ACDelco

EFI Fuel Pumps

warranty

ACDelco EFI Fuel Pumps are warranted nationally against faulty workmanship or materials for a period of 2 years or 40,000 km from the purchase date.

WARRANTY CONDITIONS

Any ACDelco EFI Fuel Pumps submitted for claim must have the fuel strainer included.

This warranty does not cover:

- / Loss of time, inconveniences, loss of use or any other consequential damages.
- / Labour for removal from and replacement of the unit from the vehicle unless prior written approval has been obtained from ACDelco.
- / Parts which have been subjected to deliberate abuse.
- / Conditions resulting from abnormal wear, negligence, alterations or accidents.
- / Damage caused by contaminated fuel.
- / Incorrect fitment.
- / Parts used in an incorrect application or parts that are not used for their intended purpose.
- / Any pump with external signs of contamination, rust or other foreign material.

Warranty may be impacted on electric fuel pumps if the following procedures are not followed:

- / The fuel tank has not been removed and cleaned of any contaminants and residue.
- / The new pump strainer has not been fitted or has been fitted incorrectly.

DISCLAIMER

Certain information in this catalogue has been compiled from data published by original equipment manufacturers and other parties. ACDelco is unable to warrant the accuracy of third party data, and does not accept responsibility for loss or damage of any kind caused as a result of such data being inaccurate.

About ACDelco

EFI fuel pumps

MANUFACTURING PROCESS

All ACDelco EFI Fuel Pumps are developed using computer aided design techniques.

All pumps are individually tested and sealed before shipping assuring performance, reliability, and customer satisfaction.

FEATURES AND BENEFITS

ACDelco Fuel Pumps come with all fitting requirements, such as:

- / Strainer
- / Gaskets
- / Hose clamps
- / Washers
- / Plug & connecting wire
- / Sleeve
- / Connecting rubber hose

Note: Fittings provided are dependent on kit and application.

ACDelco EFI Fuel Pumps that are supplied as a Module, replicate the OE assembly and include pump, sender, float and strainer in a pre-assembled unit ready to fit.

All ACDelco EFI Fuel Pumps are backed by a 2 year / 40,000 km Australia wide warranty.

ACDelco EFI Fuel Pumps are extensively tested under a variety of conditions to ensure long life.

Fitting instructions are included with each EFI Pump.

ACDelco's range is under constant development to meet the changing market needs. Check our web site for the latest applications - **www.acdelco.com.au**

Fit ACDelco EFI Fuel Pumps with confidence in the knowledge that these products meet the highest quality standards that you have come to trust.

EFI Fuel Pump installation tips

- / First diagnose reason for initial pump failure.
- / Ensure fuel tank is free from all contaminants, by removing tank and flushing.
- / Do not re-use stale or contaminated fuel.
- / When installing the pump, ensure that the work environment is clean, to prevent dirt, grit, sand, and grease from entering the pump.
- / Install the fuel filter strainer (All ACDelco EFI Fuel Pumps come with a fuel filter strainer) to the inlet port of the pump. Place the fuel strainer on a clean flat surface and push the pump down into the fuel strainer until it is fully seated.
- / When filter strainer is fitted correctly it will "snap" into place and be difficult or impossible to remove by hand (failure to ensure the fuel strainer is installed correctly may impact warranty).
- / Position new rubber isolator (when supplied) onto fuel pump inlet post, ensuring the fuel pump is fully seated and the isolator is correctly positioned in the hanger assembly.
- / After the installation has been completed, check vehicle system for leaks.
- / Always replace all EFI fuel filters otherwise over pressurising of the system could occur. (Refer to the ACDelco Filter Catalogue for the correct application details).

Customer Information

PETROL FUEL SYSTEM

Most EFI pumps are located within the fuel tank. Customers should be advised to always maintain fuel levels above a quarter full.

Fuel within the tank helps to cool the pump thus prolonging pump life.

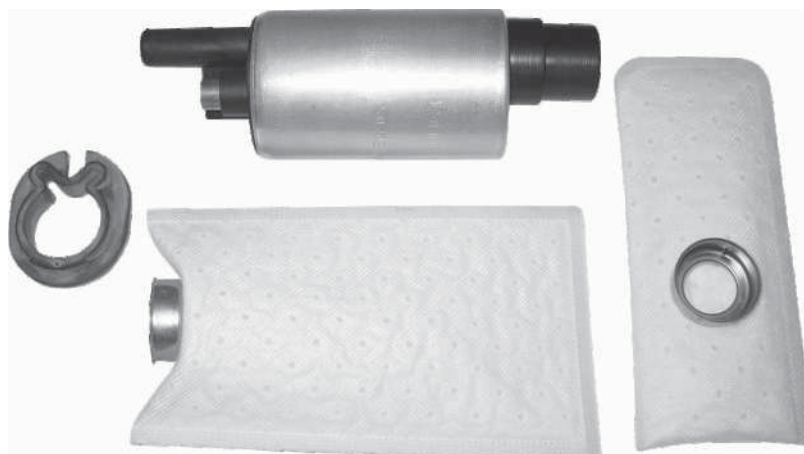

DUAL FUEL LPG SYSTEMS

It is vital that the fuel tank level is maintained above quarter full at all times to prevent pump internal components from overheating.

It is also important that the vehicle is driven on petrol at least twice a week to ensure pump lubrication is maintained. A common issue with dual fuel vehicles is that the fuel remains in the tank too long, it becomes stale, and oxidises which forms a residue that is detrimental to the pumps internal components.

FUEL SYSTEM MAINTENANCE

Encourage your customers to have the EFI in line filters replaced at the recommended service intervals. (Refer to the ACDelco Filter Catalogue for the correct application details). This will reduce the risk of the system over pressurising, which can result in a breakdown and costly fuel system repairs.

EFI Fuel Pump Malfunction diagnosis*

The EFI fuel pump is a complex component that operates with very fine tolerances and therefore it is imperative that the fuel pump operates in a clean environment or pump failure can and will occur.

Most of the EFI fuel pump failures detected by ACDelco have been a result of one or more of the following factors:

1. Water, dirt or foreign matter contamination, caused by dirty fuels or rust / scale in the tank.
2. Incorrect installation of the strainer, causing premature pump failure.
3. Running dry, causing over heating of the pump and premature failure.
4. Running the pump with reverse polarity, causing the pump to fail prematurely.
5. Incorrect voltage supply, causing the pump to fail prematurely.
6. Incorrect relay.
7. Dirty & corroded electrical connections.

Please Note:

When you change the normal operation of a fuel system to accommodate a LPG / Petrol (dual fuel) vehicle, you are changing the normal operation of the EFI fuel pump. And if the pump is not turned off when running on LPG resulting in the fuel being circulated through the fuel system, it will make the pump work harder causing a higher amperage draw, resulting in a excessive build up of heat, and ultimately failure.

Heat build-up within the tank will cause the fuel to overheat, resulting in varnish build-up or gumming occurring within the pump body and bearing surfaces restricting the lubrication between the armature and housing resulting in melt down occurring.

Fitment of the correct manufacturers fuse specifications is important to prevent melt down occurring, as any locked up pump will draw a higher level of current causing excessive heat.

ACDelco recommends, a complete fuel systems analysis be done before commencing any major work or replacement of any components, as failure to do so could result in unnecessary costly repair bills.

Troubleshooting tips*

The fuel pump is one of many components in the EFI fuel system. Before replacing a pump it is essential the root cause of the fuel system problem is correctly identified. There are many variations of the EFI system; hence it is essential you refer to the vehicle manufacturer's manual for their recommended procedure.

There are some basic checks that apply to most EFI systems.

- / Before commencing checks ensure there is sufficient fuel in the tank.
- / Also ensure checking is conducted in a clean workshop with no naked flames.

PRESSURE CHECK

- / Connect fuel pressure gauge to the system in accordance with vehicle manufacturer's procedures. Switch ignition to the 'on' position.
- / If there is no system pressure or system pressure is too low, check for blocked or damaged fuel lines or hoses, blocked pump inlet filter and blocked in-line fuel filter.
- / If system pressure is too high, switch 'off' the ignition, disconnect the fuel return line from the fuel pressure regulator, securely connect a hose to the fuel pressure regulator outlet and collect fuel into a safe container. Switch ignition to the 'on' position. If pressure reading is too high, that would indicate the fuel pressure regulator requires replacement.
- / If the pressure reading is within specifications, check fuel lines to find the restriction and correct.

ELECTRICAL CHECK

- / If system pressure is below the manufacturers specifications, switch ignition to the 'on' position. A buzzing sound should be heard from the tank indicating the pump is operating. Typically the pump will operate for a few seconds and then shut off - This is a safety feature.
- / If there is no sound heard from the pump, check for voltage at the pump.
- / If there is voltage at the pump, replace the pump and strainer assembly.
- / If there is no voltage at the pump, check the pump relay, pump relay fuse, main fusible links and oil pressure switch. Always refer to the vehicle manufacturer's handbook for specific checks.
- / Test voltage supply to the pump against manufacture specification and confirm that adequate power (amps and volts) are present to drive the pump. Check earth return circuit. Check pump relay. Always ensure that the correct OEM replacement relay is used.
- / Check for dirty & corroded electrical connections.

EFI Fuel Pump

notes

This image shows a full page of blank, lined paper. It features approximately 28 horizontal blue or grey lines spaced evenly apart, typical of notebook paper. The lines extend across the entire width of the page, leaving small margins at the top and bottom. There are no vertical lines, text, or other markings on the page.

ACDelco Product Range:

Spark Plugs

Wipers

Chemicals
