AAT

The technical performance of Iskra alternators is based on long-term relationships with the customers, their high requirements and expectations and our own long-standing experience in development and production. We control quality using standard ISO 9001 : 2000. The entire process from customer requirement and expectation, through development and production is planned and controlled in detail. High operating reliability is assured by optimising the design for use in different operating conditions, together with numerous validations of different alternators in Iskra's own laboratories and on vehicles.

Alternators are air-cooled synchronous three-phase generators with claw poles and a built-in semiconductor rectifier. A three-phase stator winding is connected to the three-phase rectifier bridge with power rectifier or Zener diodes. The rotor coil is connected to the slip rings with brushes that conduct the excitation current. Alternators are self-excited through excitation diodes or they are excited directly by the battery. The voltage regulator can be either built-in or separately mounted. The negative terminal is normally connected to the chassis.

Iskra Avtoelektrika keeps abreast of all technical innovations in the field of alternators. Its staff are aware that energy conservation in vehicles is an absolute necessity. The results are different families of alternators designed in modern compact versions with internal fans in parallel with families of conventional design using external fans. Modern versions of rectifiers and specific multifunction regulators are also available.

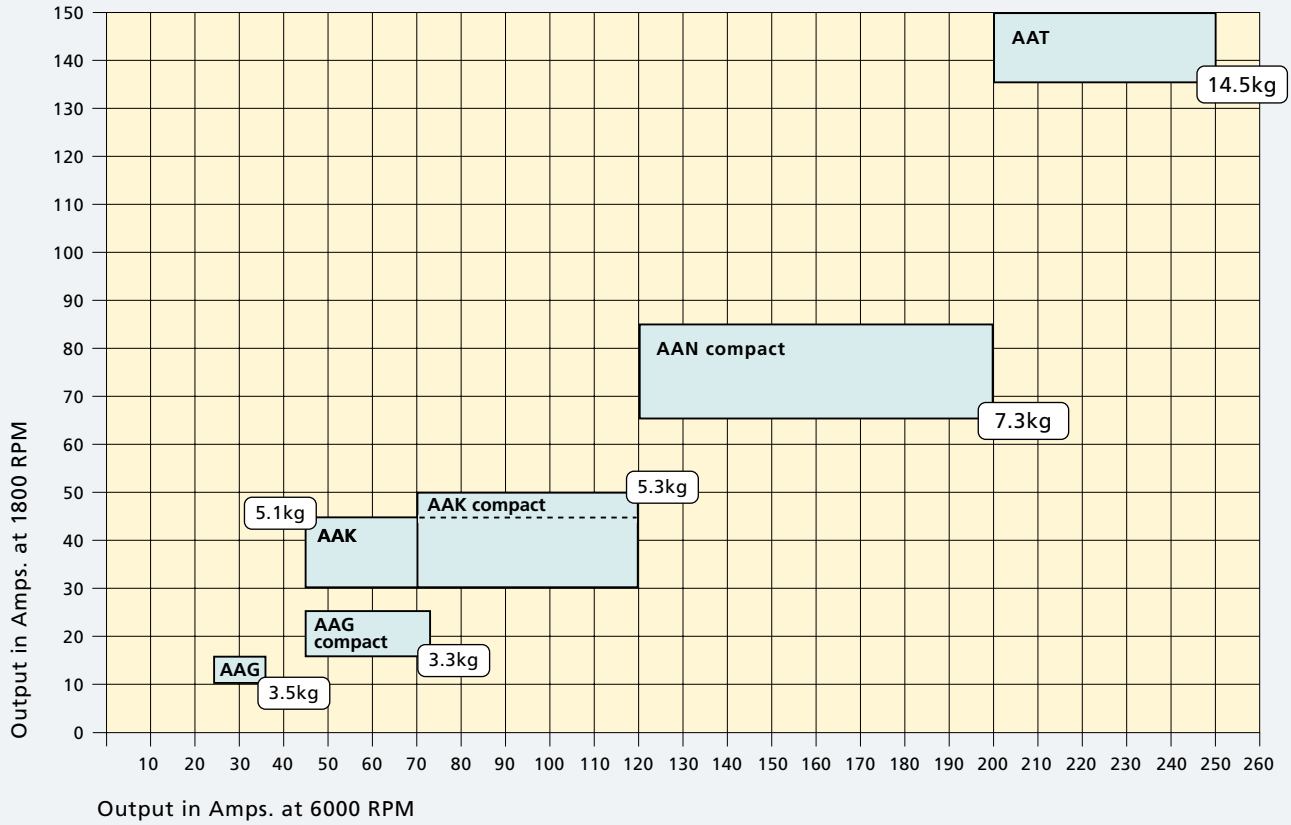
Different versions of alternators meet very high specifications in terms of resistance to salt spray, humidity, water, mud, dust, vibrations, high and low temperatures and aggressive liquids. They are also designed to meet electromagnetic compatibility and other international directives and standards. They are produced using ecologically sound technologies and environmentally friendly materials.

Iskra alternators are designed to meet a wide range of engineering specifications and applications. They are used on petrol and diesel engines in the automotive industry, on trucks, buses, tractors, construction machinery and in other applications. Different solutions of our alternators are defined taking into account the demands of each application and are designed for long life, maintenance free operation under extreme conditions.

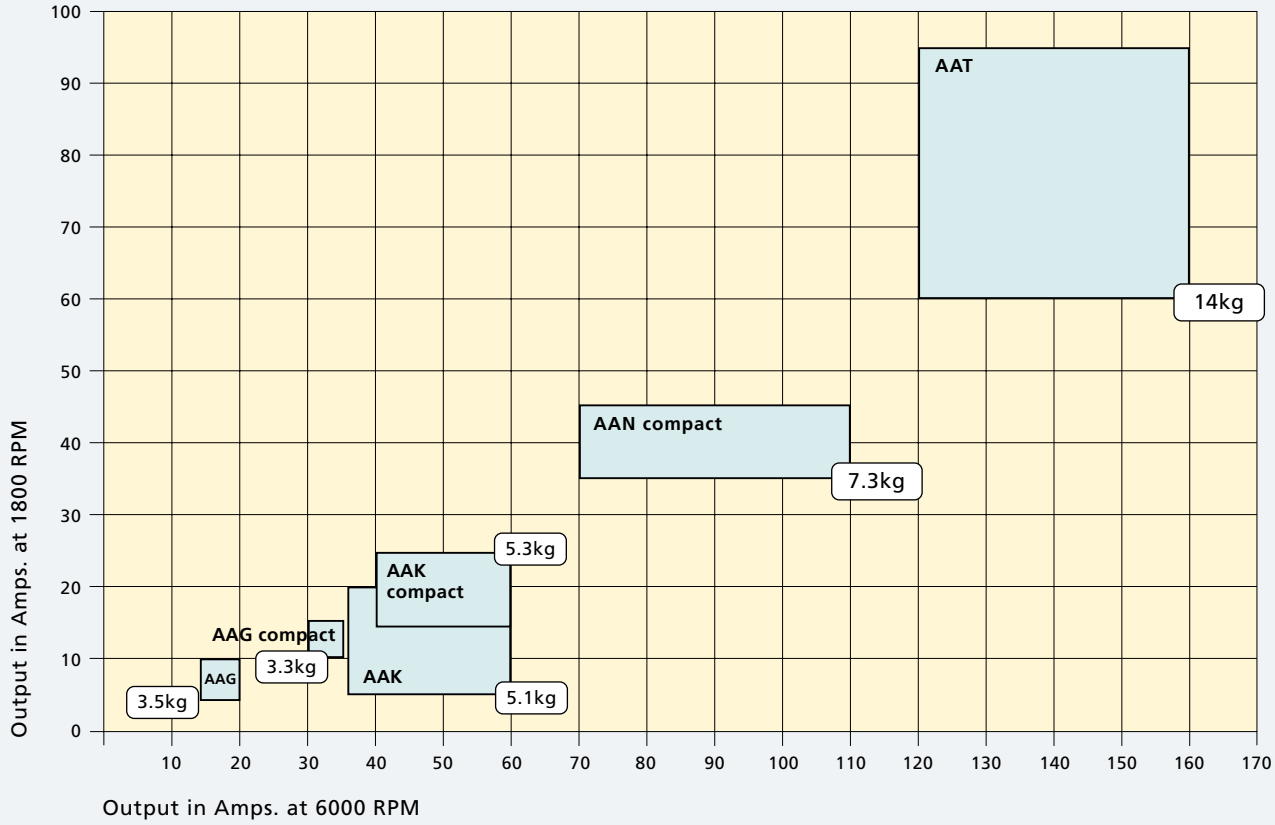
CLASSIFICATION OF ALTERNATORS

Alternators type AAG	stator diameter 108.0 mm
Alternators type AAG compact	stator diameter 108.0 mm
Alternators type AAK	stator diameter 125.0 mm
Alternators type AAK compact	stator diameter 125.0 mm
Alternators type AAN compact	stator diameter 142.0 mm
Alternators type AAT	stator diameter 165.5 mm

ALTERNATORS 14V



ALTERNATORS 28V



MAIN TECHNICAL DATA

Type	AAG	
Nominal voltage	14V	28V
Nominal current	33A - 35A	18A
Stator diameter	108 mm	
Weight (without pulley)	~3.5 kg	
Max. speed (permanent / short time)	12,000 RPM / 13,500 RPM	
Regulator	Built-in Hybrid technology	
Pulleys and drive end brackets	Different types according to customers' requirements.	
Terminals	Screw and/or blade terminal	
Drive end bearings	Type 6203 / 2RS	
Rear end bearing	Type 63001	
Power diodes	Press fit Zener diodes	
Protection of the slip rings and brushes	Protected against ingress of solid foreign matter and water spray (IP 54)	
Ambient temperature	From - 40°C to + 110°C	

APPLICATIONS

Low output powers make it possible for the alternators to be built into systems with low electrical requirements. Small dimensions allow installation on all types of combustion engines used on small tractors, small agricultural machinery, stationary engines and some other applications.

DESIGN

The alternator is a three-phase, 12-pole synchronous self-excited generator with built-in rectifier and regulator and cooled by an external fan. Various design solutions are available depending upon the application: insulated, marine, dustproof and other versions.

Cooling

The integral fan provides effective through cooling of the alternator. Two different fans are available, for CW and CCW direction of rotation.

Rotor

The rotor winding fixed between the claw poles provides excitation of the alternator through slip rings. For particularly dusty environments slip rings and brushes are additionally protected.

Rectifier

Press fit Zener diodes are mounted into protected heat sinks. Zener diodes protect the loads on the vehicle against overvoltages from the alternator.

Regulator

The monofunction regulator incorporating the brush holder is built into the alternator. The regulator is produced using thin-film hybrid technology. The highest quality brushes ensure long life of the alternator.

Brackets - Bearings - Pulleys

Brackets, bearings and pulleys are made according to the customers' requirements. A range of special sealed bearings makes it possible to design alternators for specific installations, operating in the harshest conditions whilst achieving long, maintenance free life.

Electrical terminals

Electrical terminals are according to the customers' requirements.

Protection of the slip rings and brushes	Protected against ingress of solid foreign matter and water spray (IP 54)	
Ambient temperature	From - 40°C to + 110°C	

APPLICATIONS

- for small tractors
- for small agricultural and construction machinery
- for stationary engines
- for passenger cars

Features

- high specific power and efficiency
- small dimensions
- low weight
- low noise level
- higher protection against accidental contact
- long life operation

DESIGN

The alternator is a three-phase, 12-pole synchronous self-excited generator with two internal fans and built-in regulator and rectifier. The compact construction and carefully selected materials assure improved technical characteristics and long life, service free, operation even under the harshest conditions of high and low temperatures, salt spray, humidity, water, dust, vibrations, aggressive liquids.

Stator

The stator has a three-phase winding on a laminated pack. The selected design and high filing factor of the stator slots provides improved cooling, low noise and high output characteristics.

Cooling

Two internal fans positioned on the claw poles provide more effective cooling with lower noise and higher protection against accidental contacts as well as higher output.

Rotor

The rotor field winding fixed between the claw poles provides excitation of the alternator through slip rings. Smaller slip rings provide higher brush durability, even at high speeds. Encapsulated slip rings offer increased durability of the alternator.

Rectifier

Construction of the rectifier with press fit Zener diodes provides low temperatures of the rectifier diodes, high resistance to vibrations and protections of loads on the vehicle against alternator overvoltages. The installation of the rectifier on the outer side of the rear end bracket ensures flexible arrangement of all types of terminals.

Regulator

The regulator together with the brush holder is assembled on the rear end bracket. Regulators use microelectronic technology and are mono or multifunction. The highest quality of brushes ensures long life of the alternator.

Brackets - Bearings - Pulleys

Brackets, bearings and pulleys are made according to the customers' requirements. A range of special sealed bearings makes it possible to design alternators for specific installations, operating in the harshest conditions whilst achieving long, maintenance free life.

Electrical terminals

Electrical terminals are according to the requirements of the customers.

Protection of the slip rings and brushes	Protected against ingress of solid foreign matter and water spray (IP 54)	
Ambient temperature	From - 40°C to + 110°C	

APPLICATIONS

High output power alternators to satisfy the needs for electrical energy in a wide range of applications:

- for cars
- for commercial vehicles
- for heavy-duty applications
- for special applications

DESIGN

The alternator is a three-phase 12-pole synchronous self-excited generator with built-in rectifier and regulator and cooled by an external fan. Depending upon the purpose of the installation, various versions can be supplied: insulated, marine and other versions according to special requirements.

Cooling

An integral fan provides effective through cooling of the alternator. Two different fans are used depending upon the required direction of rotation. Also special fan for hand contact protection is avaible.

Rotor

With regard to the requirements of the installation and the operating conditions, different protection levels are provided for the slip rings and brush compartment.

Rectifier

A three-phase bridge circuit with press fit Zener diodes and excitation diodes provides D.C. output currents and excitation of the alternator. Zenere power diodes provides protection of electrical loads on the vehicle against alternator overvoltages.

Regulator

Regulator with brush holder is fitted to the alternator. They are made in thin-film hybrid or microelectronic technology. With regard to the requirements of the application they may be monofunction or multifunction. The highest quality brushes ensure long life of the alternator.

Brackets - Bearings - Pulleys

Brackets, bearings and pulleys are made according to the customers' requirements. A range of special sealed bearings makes it possible to design alternators for specific installations, operating in the harshest conditions whilst achieving long, maintenance free life.

Electrical terminals

Electrical terminals are according to the customers' requirements.

MAIN TECHNICAL DATA

Type	AAT	
Nominal voltage	14V	28V
Nominal current	220A	120A -160A
Stator diameter	165.5 mm	
Weight (without pulley)	~14.5 kg	
Max. speed (permanent)	7000 RPM	
Regulator	Built-in Monofunction Hybrid technology	
Pulleys and drive end brackets	Different types according to customers' requirements.	
Terminals	Screw and/or blade terminal	
Drive end bearings	Type 62306-2RS / 6306	
Rear end bearing	Type NU 202	
Power diodes	Press fit Zener diodes	
Protection of the slip rings and brushes	Protected against ingress of solid foreign matter and water spray (IP 54)	
Ambient temperature	From - 40°C to + 110°C	

APPLICATIONS

These alternators provide very high output power and are designed to be built into applications requiring high consumption of electrical energy. They were all initially designed for installation on diesel engines in buses and some special purpose applications. They also can be used in the separate cicuits which are intended for supply Air-Condition equipments in the buses. At that case the alternator's connection diagram has different layout; alternators are operating without battery (battery-less) and without indicator lamp.

DESIGN

The alternators are three-phase, 16-pole synchronous generators, self-excited by a rotor consisting of claw poles using protected slip rings. They have a built-in rectifier and regulator and are cooled by an external fan. Design solutions and anticorrosion coatings as well as specially chosen bearings ensure long life without maintenance under normal operating conditions. For operation in extremely hard conditions - temperature, dust, water - it is advisable to ventilate the alternator using a special protection cover on the rear.

Cooling

The alternator has a built-in fan with axial - radial blades that allow rotation in both directions. It is also possible to use a low-noise fan with specially shaped blades.

Stator

A three-phase stator winding with a high filling factor of the slots and a special method of assembly provide better cooling and high output power.

Rotor

The rotor field winding provides excitation of the alternator through slip rings. With regard to the installation requirements, slip rings and brushes are protected in an enclosed environment sealed against dust and water.

Rectifier

The rectifier stack is a three-phase bridge circuit with built-in press fit power and excitation diodes. Press fit Zener diodes are used to protect alternator and loads on the vehicle against overvoltages.

Regulator

The regulator together with the brush holder is built into the rear end bracket of the alternator. Regulators are produced in thick-film hybrid technology. Monofunction versions of the regulator only are available.

Brackets - Bearings - Pulleys

The high quality specially chosen bearings provide long service free life.

Electrical terminals

Electrical terminals are according to the customers' requirements.
