# ALPHA FIX Terminal Blocks

## Screw Terminals

### 8WA neutral isolating and branch terminals

#### Overview

Neutral isolating terminals allow an insulation test to be performed without disconnecting the neutral conductor according to DIN VDE 0108 and DIN VDE 0100 (Standards for the installation of electric power equipment).

The branch terminals are used for the connection of lines (L), for example for power supplies, to the 6 mm x 6 mm busbar.

The rated voltage between two branch terminals (1 slide open) is 289 V.

When they are used as shield terminals according to DIN VDE 0160, they provide isolation between the central reference point (shield connection conductor) and the PE conductor.

#### Selection and ordering data

| Version                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | DT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Order No.   | Price per PU          | PU                    | PS*/ P. unit          | PG     |         |

## Screw Terminals

### 8WA Insta or three-tier terminals

#### Overview

The Insta or three-tier terminals incorporate up to 3 different terminal functions in one insulating body of 6 mm width. The width of 3 Insta terminals corresponds to the hole pitch of 18 mm standardized in distribution board assembly. Tools are required to remove the terminals from the support rail.

All clamping points for incoming and outgoing cables have a notch for an 8WA8 8 labeling plate. The protective conductor connections are already marked green-yellow and the neutral conductor connections blue.

The neutral busbar has the same position for Insta terminals and neutral isolating terminals. This allows, for example, the use of a 16 mm<sup>2</sup> neutral isolating terminal as an infeed for the neutral busbar.

8WA1 011-3JF16, -3JF17 and -3JF18 allow the neutral busbar to be routed with a mounting depth of 42.5 mm.

#### Insta terminal PE, L, NT

The 8WA1 011-3JF20 terminal is the basic version for AC circuits. It comprises:

- Protective conductor connection
- Through-type connection for one phase conductor

- Neutral conductor connection that can be isolated from the 6 mm × 6 mm neutral busbar.

#### PE/ground, L, N Insta terminals

If no neutral isolation is required, the 8WA1 011-3JF17 terminal is used:

- Protective conductor connection
- Through-type connection for one phase conductor
- Through-type connection for the neutral conductor

#### Insta terminal PE, L, L

Design of 8WA1 011-3JF16 terminal as previous version. Instead of the through-type connection for the neutral conductor, a through-type connection for a second phase conductor is fitted.

#### Insta terminal, L, L

8AW1 011-3JF18 terminal contains two through-type connections for two phase conductors. These are generally used for three-phase outgoing lines.

#### Terminal size 2.5 mm<sup>2</sup>

8WA1 011-3JF16

#### Insta terminals, terminal size 2.5 mm<sup>2</sup>

- Rated uninterrupted current 24 A
- Rated insulation voltage
  - 400 V between phase conductors
  - 250 V between phase and protective conductors and for neutral isolating distance
- Mounting width 6 mm
- Terminal height 42.5 mm
- Terminal length 87 mm
- Screw terminal with double conductor run
- AWG 22-12

# ALPHA FIX Terminal Blocks

## Screw Terminals

### 8WA two-tier terminals

#### Overview

Two-tier terminals are a compact form of the terminal blocks. They are therefore open on one side. They can contain two connecting cables with two connections each or they can be laid out as terminal blocks with four connections on the same potential.

An advantage is the standardized front for mounting, linking and labeling.

#### Technical specifications

|                                                                | Rated voltage |       |
|----------------------------------------------------------------|---------------|-------|
|                                                                | AC            | DC    |
| Between link rails                                             |               |       |
| • With insulation plate                                        | 400 V         | 450 V |
| • With end plate or barrier                                    | 800 V         | 900 V |
| • With jumper opened                                           | 500 V         | 600 V |
| For alternately bent soldering tags                            | 400 V         | 450 V |
| For adjacent terminals with soldering tags and insulated plugs | 250 V         | 300 V |

#### Terminal size 4 mm<sup>2</sup>

8WA1 011-6EG20

#### Diode terminals, terminal size 4 mm<sup>2</sup>

- Rated insulation voltage 250 V
- Mounting width 6.5 mm
- Terminal height 45 mm
- Terminal length 64 mm
- AWG 18-10
- No jumpering possible

The sockets of the terminal screws allow actions, such as the measuring of the loop resistance or connection of an ammeter to the circuit. The use of connection combs reduces the conductor cross-section by one level.                                                 |             |                       |                 |                 |             |     |

## Screw Terminals

### 8WA fuse terminals

#### Overview

8WA1 011-1SF12 fuse terminals are used to protect control circuits against short-circuits.

The fuse terminals are intended for 5 mm × 20 mm and 5 mm × 25 mm G fuse links up to 6.3 A and 250 V and for bridging links up to 16 A and 800 V and have a mounting for a replacement fuse link.

The fuse terminals are suitable for fuse links, sizes 1/4" × 1", 1/4" × 1 1/4" (6.3 mm × 32 mm) to 6.3 A and 250 V.

Fuse terminals are positive opening fuse-disconnectors.

The fuse links must be replaced at zero voltage. Finger safety is ensured in both closed and open positions.

The LED indicates the status of the disconnected fuse (residual current from 2 to 5 mA), but not if the plug is removed (floating).

The double connection is designed so that two conductors with different cross-sections can also be securely connected.

The fixing base of the G fuse terminal allows both centered and recessed mounting, allowing the unhindered routing of a 6 mm × 6 mm neutral busbar. The G fuse terminal can therefore be joined into a single group with the other terminals of a branch.

## Screw Terminals

### 8WA measuring transformer terminals

#### Overview

Measuring transformer terminals can be used for testing and isolating circuits in switchgear installations, control rooms, etc. without interrupting operation.

The isolating and instrument isolating terminals contain an isolating device in the through-type connection. The isolating device permits electrical separation between the input and output of a terminal.

Test sockets for plugs with a diameter of 4 mm can be screwed into the front side of the through-type and isolating terminals. The rated insulation voltage between colored test sockets is 125 V. The rated insulation voltage between test sockets and link rails which are not connected to the terminal is 16 V (circuit 3, terminals 3 and 5).

Two adjacent terminals can be connected in parallel with the disconnecting link. The disconnecting link can be operated in any position of the isolating device.

#### Instrument set for one transformer

The instrument set for one transformer makes the basic circuit of the transformer terminal blocks clear. This basic circuit is also included in much larger instrument sets, which are extended by adding on equivalent circuits. Links between the basic circuits allow many kinds of tests to be carried out, parallel outgoing feeders to other measuring instruments, the connection of test equipment etc.

#### Instrument set for three transformers

The simplest version of an instrument set for a three-phase circuit consists of three basic circuits strung together without any continuing links or extensions. Instead of isolating terminals 1, 3 and 5, less expensive through-type terminals can also be used.

On the other hand, it is also possible to use instrument isolating terminals for this purpose so that the terminal versions are all the same.

#### Instrument set for three transformers with neutral point

The instrument set with a neutral point is an extension of the previous circuit. Four instead of six lines are sufficient for connecting it to the measuring instruments. The neutral point is produced on the measuring instruments on the one hand, and using a shortened 8WA1 822-7VH10 link rail on the other. The instrument isolating terminal 1 is connected to the neutral point using a connection comb.

#### Note

The introduction of the 8WA1 011-1MH10 through-type terminals and their associated disconnecting links has made it considerably easier to configure terminal sets for current transformers. Now, instead of the 12 isolating or instrument isolating terminals used previously, only four instrument isolating terminals and three through-type terminals are required.

#### Instrument set with test facility

This instrument set represents a significant enhancement over previous types. In normal operation, terminals 2, 5 and 8 are closed. For testing a measuring instrument (e.g. a plotter), these terminals are opened and terminals 3, 6 and 9 are closed in order to feed in a test signal. The transformers first have to be short-circuited with the disconnecting links between terminals 1-2, 4-5 and 7-8. Wire bridges connect terminals 1, 4 and 7 with the neutral point. It is formed in terminals 10, 11, 12 and 13 with an 8WA1 887 link rail.

# ALPHA FIX Terminal Blocks

## Screw Terminals

### 8WA transformer terminals

#### Overview

The 8WA9 200 terminals are used for transformers and rectifiers.

The terminals are insulated on both sides, and are finger-safe according to DIN VDE 0106 Part 100.

The normal labeling accessories can be used to label the transformer terminals.

In addition to the screw terminal, the 8WA9 terminals have a 6.3-0.8 flat connector. Once the conductor is soldered in place, the soldering connection is protected by a swiveling cover.

#### Selection and ordering data

## Screw Terminals

### 8WH shield terminals

#### Overview

In industrial process engineering, a high interference immunity is required for electrical instrumentation and control. It is a decisive factor in the availability of industrial equipment. When designing low-interference systems, great importance is placed on cable shielding and the respective shield ground. The critical point is where the cable shield is connected to the enclosure ground. The connection should have a low resistance and a low inductive reactance, while being quick and easy to set up. The shield terminals are ideally suited for this purpose and can be used with all common cable shields.

The effectiveness of cable shields depends to a large extent on the contact quality of the shield connection. The shield terminals have a large, low-impedance contact area with the shield, which reduces the voltage drop across it. Connected at one end only, shields can help reduce only low-frequency, capacitive interference, such as that caused by high-voltage installations.

To protect from the much more common inductive interference signals, the cable shield must be connected at both ends.

However, differences in the ground potential can cause a compensating current to flow through the cable shield.

To reduce this unwanted current, it is advisable to connect the shield at several points along its length. The shorter the spaces between the clamping points, the smaller the compensating currents in the cable shield. In systems where safety is especially important, triax shields are used. These consist of two braids that are insulated from each other, with the outer shield connected at both ends and the inner one at only one end. With this arrangement, the compensating currents and the inductive interference are conducted through the outer shield, and the capacitive interference dissipated through the inner shield.

Depending on the length of the terminal strip, two or more support brackets are fitted, which provides both an electrical and a mechanical connection from the busbar to the support rail and therefore to the enclosure ground. The shield terminal is simply fitted to the busbar after all wires have been connected.

A spring-loaded pressure plate regulates the force applied to the cable to ensure an optimum contact with the busbar at all times.

If the cable shield is to be connected at another point of the control cabinet instead of directly in front of the terminal strip, we recommend using support brackets made of molded plastic.

## Screw Terminals

### General technical specifications

#### Technical specifications

##### Continuous load at increased ambient temperatures

To 8WA1 terminal blocks, the full uninterrupted current can be applied at ambient temperatures of up to +55 °C. At higher ambient temperatures, a current reduction according to the following formula is required:

$$I_{th2'} = I_{th2} \cdot k$$

$I_{th2}$  = Uninterrupted current according to selection tables, relative to the nominal cross-section

$I_{th2'}$  = Uninterrupted current at increased ambient temperature

$k$  = Derating factor according to table

| Ambient temperature | Derating factor $k$ |
|---------------------|---------------------|
| 60 °C               | 0.94                |
| 65 °C               | 0.88                |
| 70 °C               | 0.82                |
| 75 °C               | 0.75                |

<sup>1)</sup> Tightening torque also applicable for accessories (socket, link rails, etc.)

##### Standard mounting rails as PEN rails

Only Cu busbars must be used.

They must have the same current carrying capacity as protective conductor busbars.

PEN busbars must carry only terminals, and no devices.

##### Standard mounting rail as protective conductor busbar

Protective conductors with a larger cross-section than the protective conductor busbar and with the same conductivity can be connected to standard mounting rails that are also protective conductor busbars and carry current only under fault conditions.

# ALPHA FIX Terminal Blocks

## Screw Terminals

### General technical specifications

#### Rated impulse withstand voltage of terminal blocks

Values depend on the mains rated voltage ≤ rated insulation voltage of terminal block; excerpt from EN 60947-1, table H.1.

Terminal blocks are tested to overvoltage category III.

| Rated mains voltage<br>(≤ Rated insulating<br>voltage of the device)<br>RMS value<br>V AC | Highest rated operational voltage to<br>ground<br>RMS value<br>V AC or DC | Preferred values for rated impulse withstand voltage<br>as 1.2/50 μs-pulse<br>Overvoltage category |          |           |          |

<sup>1)</sup> End sleeves according to DIN 46228 Sheet 1 without insulation. Size corresponds to sleeve nominal size.

<sup>2)</sup> 0.12/0.25 mm<sup>2</sup> corresponds to Ø 0.4/0.6 mm.

<sup>3)</sup> For 0.75 mm<sup>2</sup> conductors, use end sleeves 1-10 and press on with insert E1 or PZ 1.5.

<sup>4)</sup> At voltages > 500 V, shorten end sleeves with inserted conductor to 10 mm before pressing on.

<sup>5)</sup> Tested up to 16 mm<sup>2</sup>.

<sup>6)</sup> Fit and press on two end sleeves behind one another (to stop).

<sup>7)</sup> Voltage reduction to 630 V required.

<sup>8)</sup> With screw terminals.

<sup>9)</sup> With PZ 1.5 on top of each other .

<sup>10)</sup> Stripped length 27 mm.

<sup>11)</sup> Cable lug according to DIN 46235.

<sup>1)</sup> End sleeves according to DIN 46228 Sheet 1 without insulation. Size corresponds to sleeve nominal size.

<sup>2)</sup> 0.12/0.25 mm<sup>2</sup> corresponds to Ø 0.4/0.6 mm.

<sup>3)</sup> For 0.75 mm<sup>2</sup> conductors, use end sleeves 1-10 and press on with insert E1 or PZ 1.5.

<sup>4)</sup> At voltages > 500 V, shorten end sleeves with inserted conductor to 10 mm before pressing on.

<sup>5)</sup> Tested up to 16 mm<sup>2</sup>.

<sup>6)</sup> Fit and press on two end sleeves behind one another (to stop).

<sup>7)</sup> Voltage reduction to 630 V required.

<sup>8)</sup> With screw terminals.

<sup>9)</sup> With PZ 1.5 on top of each other .

<sup>10)</sup> Stripped length 27 mm.

|    | Isolating blade terminals                                                                                | 12/29 | Isolation of the circuit, e.g. for test purposes                                                                        |
|   | Isolating terminals                                                                                      | 12/32 | Isolation of the circuit, e.g. for test purposes                                                                        |
|  | Two-tier terminals                                                                                       | 12/35 | Compact design of the terminal blocks, which can accommodate installation of two connecting cables                      |
|  | Three-tier terminals  | 12/41 | Compact terminal blocks up to 2.5 mm <sup>2</sup> , which can accommodate installation of three connecting cables       |
|  | Four-tier motor terminals                                                                                | 12/43 | Compact terminal blocks up to 4 mm <sup>2</sup> , which can accommodate installation of three connecting cables plus PE |
|  | Diode terminals                                                                                          | 12/45 | Terminal blocks with integrated diodes                                                                                  |
|  | Two-tier diode terminals                                                                                 | 12/47 | Terminal blocks with integrated diodes                                                                                  |
|  | Compact through-type terminals                                                                           | 12/50 | Compact terminals up to 6 mm <sup>2</sup> with small longitudinal dimensions                                            |

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### Introduction

|                                                                                     | Devices                           | Page  | Application                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------|-----------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Compact isolating blade terminals | 12/58 | Compact terminals up to 2.5 mm <sup>2</sup> with small longitudinal dimensions and isolation of circuits, e.g. for test purposes                                                                        |
|    | Compact isolating terminals       | 12/60 | Compact terminals up to 2.5 mm <sup>2</sup> with small longitudinal dimensions and isolation of circuits, e.g. for test purposes                                                                        |
|    | Compact two-tier terminals        | 12/62 | Compact terminal blocks up to 4 mm <sup>2</sup> , which can accommodate installation of two connecting cables                                                                                           |
| <b>8WA terminals</b>                                                                |                                   |       |                                                                                                                                                                                                         |
|    | Through-type terminals            | 12/67 | Connection of incoming and outgoing cables up to 35 mm <sup>2</sup>                                                                                                                                     |
|   | Neutral isolating terminals       | 12/72 | Connection of neutral isolating terminal to neutral busbar 3 mm × 10 mm                                                                                                                                 |
|  | Two-tier terminals                | 12/74 | Compact terminal blocks up to 4 mm <sup>2</sup> , which can accommodate installation of two connecting cables                                                                                           |
|  | Fuse terminals                    | 12/76 | Terminals up to 4 mm <sup>2</sup> that protect, e.g. control circuits                                                                                                                                   |
|  | Terminals for components          | 12/77 | Terminals up to 4 mm <sup>2</sup> that enable installation of components in the circuit                                                                                                                 |
|  | Diode terminals                   | 12/78 | Terminal blocks (2.5 mm <sup>2</sup> and 4 mm <sup>2</sup> ) with integrated diodes or isolation for test purposes                                                                                      |
|  | Sliding-link terminals            | 12/79 | Terminal blocks with 2.5 mm <sup>2</sup> for isolation for test purposes                                                                                                                                |
|  | Insta or three-tier terminals     | 12/80 | These terminals have up to three terminal functions in one enclosure and connection to a neutral busbar 10 mm × 3 mm. They are optimized for distribution board applications in installation technology |
|  | Initiator/actuator terminals      | 12/83 | Special terminals for connection of sensors and actuators                                                                                                                                               |

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### General data on 8WH

#### Overview

| Conductor cross-section | Connection type →            |              | Standard spring-loaded connection |          |          |          |          | Order No.<br>(digits 8 ... 12) |
|-------------------------|------------------------------|--------------|-----------------------------------|----------|----------|----------|----------|--------------------------------|
|                         | Connection type →            |              | Standard                          |          |          | Two-tier |          |                                |
|                         | Number of clamping points →  |              | 2                                 | 3        | 4        | 4        | 6        |                                |
|                         | Order No. (Digits 1 ... 7) → |              | 8WH2 000                          | 8WH2 003 | 8WH2 004 | 8WH2 020 | 8WH2 023 |                                |

<sup>1)</sup> Only the main terminal types are listed here. You will find further versions on the following pages.

#### Rated short-time withstand current

Our terminals with spring-loaded connection are able to withstand a rated short-time current corresponding to a current density of 120 A/mm<sup>2</sup> specific to the nominal cross-section for a duration of one second.

## ALPHA FIX Terminal Blocks

### Terminals with Spring-Loaded Connection

General data on 8WH

The space-saving design and conductor routing from above make spring-loaded terminals ideal for controlgear installations with minimum available space. The terminals are open at one end and can be closed using the appropriate covers.

The large and unambiguous marking in the center of the terminal is essential for ensuring reliable installation in minimum time. Each clamping point can also be separately labeled.

Spring-loaded terminals provide a large connection compartment for fast wiring of flexible and rigid conductors, including conductors with the nominal cross-section and a fitted end sleeve.

Reducing combs enable easy connection of terminals with various nominal cross-sections. Reducing combs allow quick assembly of infeed blocks, e.g. to connect a 10 mm<sup>2</sup> spring-loaded terminal with a 2.5 or 4 mm<sup>2</sup> spring-loaded terminal.

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### General data on 8WH

The 2- to 50-pole connecting combs also considerably reduce the time needed for assembly and wiring as they enable up to 50 terminals to be connected in a single step.

The universal plug-in zones of the isolating terminal can accommodate isolated through-type connectors, isolating plugs, component connectors and fused connectors.

Contact tabs can be removed from the standard comb in order to skip individual terminals. This means that two potentials can run in parallel on a single terminal strip. The contact points can also be marked.

The component connector enables the convenient equipping with electronic components. One turn of the screwdriver opens the contact points and the component is easily inserted.

## ALPHA FIX Terminal Blocks

### Terminals with Spring-Loaded Connection

General data on 8WH

A comprehensive range of test accessories is also available for the spring-loaded terminal series. The test adapters for Ø 4 mm test plugs and modular test plugs enable all measuring and testing jobs to be performed in minimum time.

Cover segments are used to cover the projecting terminal segments of three and four-wire terminals when mounting two-wire terminals side-by-side. This guarantees touch protection.

*Note: The accessories for 8WH can only be used for 8WH terminals.*

The compartment partitions project beyond the contours of the terminals and separate the groups both visually and electrically.

## Terminals with Spring-Loaded Connection

### 8WH through-type terminals

#### Overview

#### With two clamping points

The through-type terminals have an impressive space-saving design and offer optimized handling. With its front connection arrangement this series provides additional space between the cable ducts for wiring.

The double bridge slot enables individual chain bridging with connecting combs. Accessories are available for testing and labeling.

#### With three clamping points

Terminals with three clamping points are a space-saving alternative to the standard through-type terminals for branching the potential.

It is often necessary for three conductors to be routed to a single terminal. This three clamping point version enables this without the need for additional terminals and bridges.

#### With four clamping points

The double connection of the through-type terminals with four clamping points enables four conductors to be connected to a single potential. These versions are therefore suitable for use as compact potential distributors.

#### PE/ground conductor function

The through-type PE terminals are available with the same contour as the through-type terminals. Simply snap the terminals onto the rail to achieve full mechanical and electrical contact with the support rail.

The through-type PE terminals meet all the requirements of IEC 60947-7-2:

- Low contact resistance
- Non-corroding clamping points
- Green-yellow enclosure
- Additional inscription options

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WH hybrid through-type terminals

#### Overview

The terminal connection compartment, on the tension spring side as well as the screw side, enables connection to a nominal cross-section of 2.5 mm<sup>2</sup> or 4 mm<sup>2</sup>, with or without end sleeves. The advantages of the different connection types result from the fact that the spring-loaded terminal of the hybrid through-type terminal is used inside the control cabinet and the universal screw connection is used at the end user's side. A PE terminal with the same contour is available for the three-conductor terminal. Contact is made by simply snapping the terminal onto the support rail. This meets the requirements of IEC 60947-7-2:

- Low contact resistance
- Non-corroding clamping points
- Green-yellow enclosure
- Additional inscription options

#### Technical specifications

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WH fuse terminals

#### Overview

#### Fuse terminals for blade-type fuses

The fuse terminals for blade-type fuses use blade-type fuses to ISO/DIS 8820 / DIN 72581-3 as fuse elements. Terminals with LED display are available for fast fault diagnosis "at a glance".

#### Fuse terminals for G fuse links

Fuse terminals perform two important tasks in connected electrical systems. Firstly, they act as a fuse carrier and, secondly, as a potential distributor.

The full-length bridge slot enables uninterrupted linking between the through-type terminals and the fuse terminals.

Fuse terminals for G fuse links are available for standardized electrical fuse formats 5 x 20 mm and 6.3 x 32 mm (inch fuse) - and are optionally available with LED display to signal a blown fuse.

<sup>1)</sup> Please note: G fuse holders must be selected according to the max. power loss (heat dissipation) of the G fuse links. Depending on the application and installation method, the heating conditions must be tested in enclosed fuse holders. Higher ambient temperatures add to the load of the fuse links, so that the offset of the rated current must also be taken into account. When selecting G fuse links, make sure that they do not exceed the specified maximum power loss. For specification details, contact the fuse manufacturer.

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WH isolating blade terminals

#### Overview

Through-type terminals with isolating blade capability are the most commonly used terminal types in instrumentation and control.

Key features of these isolating blade terminals with a nominal cross-section of 2.5 mm<sup>2</sup> are their narrow width of only 5.2 mm and their high current carrying capacity of 16 A. In addition, the terminals provide a test pick-off parallel to the isolating point for 2.3-mm Ø test plugs. Potential distributors can be conveniently built with connecting combs.

Terminals with three and four clamping points are available for multi-conductor connection. With their compact design these terminals can also be used in small terminal boxes and their front connection arrangement enables user-friendly wiring.

The isolating blade is secured to the terminal so that it cannot be lost.

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WH isolating terminals

#### Overview

The isolating terminals are available with the same contour as the isolating blade terminals. Key features of the terminals are their narrow width of only 5.2 mm and their high current load rating of 16 A.

There is a test option for 2.3 mm Ø test plugs on both sides of the isolating point.

The slim 6.2 mm isolating terminal with terminal size 4 mm<sup>2</sup> is a base terminal and is used for holding:

- Isolating plugs
- Through-type connectors
- Fused connectors
- Component connectors

#### Technical specifications

|                                                                                       | 8WH2 000-6AF00   | 8WH2 500-6AF00   | 8WH2 003-6AF00   | 8WH2 004-6AF00 | 8WH2 000-6AG00    |
|---------------------------------------------------------------------------------------|------------------|------------------|------------------|----------------|-------------------|

## Terminals with Spring-Loaded Connection

### 8WH two-tier terminals

#### Overview

#### Standard two-tier terminals

With the two voltage levels routed through two separate tiers, the two-tier terminals require 50 % less space than equivalent single-tier terminals. To implement a wide range of switching tasks, connecting combs can be fitted to both tiers of the spring-loaded terminal series. Facilities for inscription are provided at each clamping point.

#### PE/ground conductor function

Perfect mechanical and electrical contact with the support rail is assured by simply snapping the terminals onto the rail.

The PE two-tier terminals meet all the requirements of IEC 60947-7-2:

- Low contact resistance
- Non-corroding clamping points
- Green-yellow enclosure
- Additional inscription options

#### PE/L and PE/N types

The PE/L and PE/N types provide a PE/ground contact to the support rail in the lower tier. The upper tier is designed as a through-type tier. Color coding of the PE and neutral tiers enables clear and unambiguous distribution of the potential.

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WH three-tier terminals

#### Overview

Our three-tier terminals offer three feed-through levels in a slim 5.2 mm terminal enclosure. They enable high wiring density - ideal for switchgear and control gear systems where space is at a premium.

With one bridge slot per tier, these terminal blocks are ideal for use as compact potential distribution boards or initiator terminals.

All six clamping points are interconnected on the equipotential bonding versions.

The three-tier terminal range is rounded off with a PE terminal with the same contour.

The three-tier terminals support inscription on each tier. In addition, label holders can be used to provide a larger inscription for the three tiers.

#### Benefits

- Three feed-through levels with minimum footprint
- Comprehensive range of inscription options
- Matching accessories for 8WH terminal range
- One bridge slot per level

#### Technical specifications

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

8WH four-tier motor terminals

### Overview

#### Terminal size 2.5 mm<sup>2</sup>

Four-tier motor terminals with terminal size 2.5 mm<sup>2</sup> are particularly suited for the compact wiring of three-phase loads. They have three through-type tiers and a PE terminal which makes contact when it is simply snapped onto the support rail.

Each clamping point has a facility for inscription and a test option for 2.3 mm Ø test plugs.

There is also sufficient space to make a large marking in the center of the terminal.

No cross-linking option.

#### Terminal size 4 mm<sup>2</sup>

Like the 2.5 mm<sup>2</sup> version, the four-tier motor terminal with 4 mm<sup>2</sup> also enables three phases and the PE to be wired in one terminal. This terminal is enclosed on both sides.

No cross-linking option.

#### Integrated PE/ground conductor function

PE contact with the support rail is made by simply snapping the terminal onto the rail. The four-tier motor terminal with terminal size 4 mm<sup>2</sup> is therefore particularly suited for the space-saving wiring of three-phase loads.

## Terminals with Spring-Loaded Connection

8WH diode terminals

### Overview

Diode terminals with a nominal cross-section of 2.5 mm² and a mounting width of just 5.2 mm can be used to implement many different switching tasks. The diode is soldered in from left to right or vice versa as required.

### Technical specifications

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

8WH two-tier diode terminals

### Overview

Two-tier diode terminals can be used together with different versions to implement many different switching tasks.

The following circuits are possible in the tightest spaces:

- Freewheel diode circuits
- Lamp test circuits
- Signaling and fault signaling circuits

### Technical specifications

## Terminals with Spring-Loaded Connection

### 8WH compact through-type terminals

#### Overview

#### With two clamping points

The compact through-type terminal series is characterized by the angled routing of the conductors. This compact range of terminals is largely used in wiring systems where underfloor wiring is used to save space.

The compact through-type terminals are available in the cross-sectional ranges 2.5 mm<sup>2</sup>, 4 mm<sup>2</sup> and 6 mm<sup>2</sup>. With terminal size 2.5 and 4 mm<sup>2</sup> they have four bridge slots, enabling numerous potential bridging options and the use of a comprehensive range of test accessories.

The product range includes PE terminals with the same contour, which meet all the requirements of IEC 60947-7-2.

#### With three clamping points

The three-conductor spring-loaded terminals have the same contour as the two-conductor through-type terminals. The uniform connecting comb system also enables cross-connection to adjoining through-type terminals.

The compact through-type terminals are available in the nominal cross-sections 2.5 mm<sup>2</sup> to 6 mm<sup>2</sup>.

#### With four clamping points

The compact four-wire terminals have the same contour as the through-type and three-conductor terminals with the same cross-section.

No cross-linking option.

#### PE/ground conductor function

PE/ground conductor terminals with the same contour are also available for the compact through-type terminals. Contact with the support rail is achieved by simply snapping the terminals onto the rail. This meets all the requirements of IEC 60947-7-2.

12

| Conductor cross-section | Connection type →            |              | Compact spring-loaded connection |          |          |          | Order No.<br>(digits 8 ... 12) |

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WH compact isolating blade terminals

#### Overview

The compact isolating blade terminals provide a test option for 2.3 mm Ø test plugs on both sides of the isolating point.

The double bridge slot also enables cross-connection to the standard two and three-conductor terminals.

The isolating blade is secured to the terminal so that it cannot be lost.

#### Technical specifications

## Terminals with Spring-Loaded Connection

### 8WH compact isolating terminals

#### Overview

The compact isolating terminals provide a test option for 2.3 mm Ø test plugs on both sides of the isolating point.

The double bridge slot also enables cross-connection to the standard two and three-conductor terminals.

The compact isolating terminal is used for holding:

- Isolating plugs
- Fused connectors
- Component connectors
- Through-type connectors

#### Technical specifications

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WH compact two-tier terminals

#### Overview

The product range of the two-tier terminals is rounded off by the compact two-tier version with nominal cross-sections 2.5 and 4 mm<sup>2</sup>.

With the potentials routed in a 5.2 mm grid through two tiers, the compact two-tier terminals require 50 % less space in the control cabinet. The terminal also offers two integral bridge slots and two facilities for large inscriptions in the center of the terminal.

¹) Cross-sections calculated according to IEC 60439-1 / EN 60439-1 / EN 60439-1 / VDE 0660 Part 500.

²) Steel protective conductor busbars are not permissible for PEN function.

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

General data on 8WA

### Overview

Terminal blocks are used for the space-saving connection of incoming and outgoing lines in switchgear and distribution boards.

#### Benefits

- Fast mounting
  - Simply snap on
  - Enclosed at both ends, no end plates required
- Simple connection
  - Front connection, no end sleeves required
  - 15° angle between screwdriver and conductor
  - Same screwdriver for terminal sizes 1.5, 2.5, 4 and 6 mm<sup>2</sup>
  - Screwless connection of neutral isolating terminal to N bar
- Small number of linking accessories
  - Screwless cross connection system consisting of only 3 accessories: Two-pin jumpers, link rails with one-pin plugs for terminal sizes 2.5, 4 and 6 mm<sup>2</sup>.
- Uniform labeling plates on cards for the entire terminal range up to 16 mm<sup>2</sup>.

#### Standards

EN 60664-1, EN 60999 and IEC 60947-7-1 or IEC 60947-7-2.

For 8WA2, the size of the connecting holes corresponds to the rated cross-sections of the conductors.

The terminals are finger-safe to IEC 60529 and EN 50274 (except for those without covers or unconnected cable entries 10 mm<sup>2</sup> and 16 mm<sup>2</sup>). Through-type terminals are resistant to earthquakes according to IEC 60068-2-6.

#### Rated short-time withstand current

Our terminals with spring-loaded connection are able to withstand a rated short-time current corresponding to a current density of 120 A/mm<sup>2</sup> specific to the nominal cross-section for a duration of one second.

#### Colored terminal blocks

With colored wiring according to EN 60204-1, the connecting level can also be included in the colored markings:

- Red for control circuits with AC current
- Blue for control circuits with DC current or neutral conductor
- Orange for interlock circuits with AC or DC current which are fed from outside and are live when the main switch is turned off
- Green-yellow through-type terminals for protective conductors (without a link to the support rail).

#### Testing

Testing is possible without interrupting operation by inserting the test plug into the provided opening, whereby the following test plug arrangement must be observed:

#### Design

The terminal blocks are insulated on both sides. End plates are therefore not required. The symmetrical design of the standard terminals prevents them from being snapped on the wrong way round. The insulating bodies up to and including terminal size 16 mm<sup>2</sup> are made of thermoplastic, polyamide 6.6 with a tracking resistance of CTI 600 according to DIN VDE 0303 Part 1.

The materials used are environment-friendly: For example, they are cadmium-free and contain no halogens or silicone.

The plastics used are flame-retardant and self-extinguishing according to EN 60695-2-2, VDE 0471, Part 2-2 and UL 94 V-2.

8WA2 through-type terminal without screws, sectional view

#### Terminal size

The terminal size corresponds to the rated cross-section. According to IEC 60947-7-1, one finely stranded copper conductor without end sleeve can be connected to each clamping point. If the rated cross-section is connected with an end sleeve, the next larger terminal size has to be used. End sleeves should only be used in particularly corrosive ambient atmospheric conditions.

#### Clamping methods

The clamping point is opened by inserting a screwdriver, the conductor is inserted to the stop and is clamped tight after the screwdriver is removed. This ensures compliance with all national and international tensile requirements. The spring steel of the spring-loaded terminal is of nickel-chromium, ensuring that the contacting between the conductor and the terminal is corrosion-proof and vibration-resistant.

#### Mounting

The terminals are snapped onto 35 mm support rails according to IEC 60715 TH35 and secured against movement with end retainers. A lateral mounting tolerance of 0.2 mm must be observed.

#### Connection of conductors

Due to the spring-loaded terminal system, solid, stranded or finely stranded conductors can be clamped safely and permanently by front insertion and without the use of end sleeves. One conductor per clamping point can be connected. The cable entries are designed in such a way that the insulation of the rated conductor cross-section, and that of the next smaller cross-section cannot be caught in the opening (the length of insulation to be stripped is printed on the terminal). As a splice protection measure when using finely stranded and very finely stranded conductors, the ends can be tin-coated or compacted by means of ultrasound.

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### General data on 8WA

#### Connection of aluminum conductors

Spring-loaded terminals are also suitable for solid aluminum conductors of up to 4 mm<sup>2</sup> when the normal preparation guidelines are complied with prior to connection, e.g. brushing and greasing.

It must also be taken into account that the rated uninterrupted currents will be lower due to the lower conductivity of aluminum:

- 1.5 mm<sup>2</sup> = 10 A
- 2.5 mm<sup>2</sup> = 16 A
- 4 mm<sup>2</sup> = 22 A

#### Accessories

##### Note

8WA accessories can only be used for 8WA terminals.

##### Linking system

The two-pin jumper is used for the linking of adjoining terminals. To connect non-adjacent terminals the link rail, which can be cut to any required length, is inserted into the linking ducts and the terminals are connected with the one-pin plugs.

##### Jumpers and plugs

No linking accessories are necessary for initiator/actuator terminals.

##### Insulation plates

8WA2 836 or 8WA2 845 insulation plates are used for isolation of the link rails.

##### Barriers

The yellow barriers protrude from the terminal line and are used as visual separation as well as to increase the rated insulation voltage.

##### End retainers and accessories

The 8WA2 808 end retainers are snapped onto the standard mounting rails to prevent the terminals from sliding out of place. For insulation of the 8WA2 842 neutral busbar, the 8WA2 837 busbar end (8WA2 826 for Insta terminals) is inserted in the end retainer.

There are several options for labeling the end retainers: the 8WA1 806 end labeling plate, the 8WA8 826-0A. terminal strip label and 4 labeling plates. The end retainers can also be used for the 8WA1 terminals with the 6 x 6 mm neutral busbar.

##### Retaining plates

The 8WA2 835 and 8WA2 844 retaining plates are used for fixing the 8WA2 830 link rail in position and for removing it from the linking duct.

##### Labeling accessories

For easier handling, the 8WA8 84. and 8WA8 86. labels are provided in card form with horizontal or vertical inscription, suitable for all terminals from 1.5 to 70 mm<sup>2</sup>.

The 8WA2 850 label holders are included in delivery with the two-tier terminals. They can also be snapped into the sockets for test plugs on the standard terminals.

The 8WA2 838 group label is snapped onto retaining plates or insulation plates.

##### Lockouts

The 8WA2 848 lockout prevents impermissible switching of the neutral disconnector on terminals with a neutral isolating function.

##### 10 x 3 mm neutral busbars and accessories

The 8WA2 843 busbar support is included in delivery with the 8WA2 011-1NK23 and -3JG11 feeder terminals. The busbar support can be inserted into the neutral isolating terminals or the Insta terminals with neutral isolating function in order to fix the 8WA2 842 neutral busbar in position.

##### Test plugs

The terminals have openings for 8WA1 867 test plugs.

8WA2 011-2DG40

#### Two-tier terminals, terminal size 4 mm<sup>2</sup>, 1-pole

- Rated uninterrupted current 32 A
- Rated insulation voltage 800 V
- Mounting width 6.2 mm
- Terminal height 45.5 mm
- Terminal length 88.2 mm
- AWG 28-12
- AWG 26-12
- With 1 x three clamping points
- Light gray

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WA fuse terminals

#### Overview

Fuse terminals are used to protect control circuits against short-circuit.

The fuse terminals are intended for 5 mm × 20 mm and 5 mm × 25 mm G fuse links up to 6.3 A and 250 V and for bridging links up to 16 A and 800 V and have a mounting for a replacement fuse link.

Fuse terminals are positive opening fuse-disconnectors.

The fuse links must be replaced at zero voltage.

Finger safety is ensured in both closed and open positions.

The LED indicates the status of the disconnected fuse (residual current from 2 to 5 mA), but not if the plug is removed (floating).

The fixing base of the terminal allows both centered and recessed mounting, allowing the unhindered routing of a 10 mm × 3 mm copper busbar. The fuse terminal can therefore be combined with other terminals of a branch to form a group.

#### Selection and ordering data

| Version | DT | Order No. | Price per PU | PU      | PS*<br>P. unit | PG |
|---------|----|-----------|--------------|---------|----------------|----|
|         |    |           |              | Unit(s) | Unit(s)        |    |

##### General details

- Thermoplastic insulating body
- Front connection with spring-loaded terminal
- Enclosed at both ends

#### Terminal size 4 mm<sup>2</sup>

8WA2 011-1SG20

8WA2 011-1SG20

##### Fuse terminals, terminal size 4 mm<sup>2</sup>

- Light gray
- Rated uninterrupted current 6.3 A (when using fuses)
- Mounting width 10 mm
- Terminal height 32.5 mm
- Terminal length 73.5 mm
- Screwless

##### Versions

- Rated insulation voltage 800 V
- Rated insulation voltage 24/250 V, with LED, 24 V AC/DC
- Rated insulation voltage 48/250 V, with LED, 48 V AC/DC
- Rated insulation voltage 230/250 V, with LED, 230 V AC/DC

##### Accessories

##### G fuse links

- Quick, high breaking capacity: 1.5 kA
  - Rated uninterrupted current 1 A
  - Rated uninterrupted current 1.6 A
  - Rated uninterrupted current 2.5 A
  - Rated uninterrupted current 4 A
  - Rated uninterrupted current 6.3 A
- Slow, low breaking capacity: 35 A at  $I_n \leq 2.5 A$ ,  $10 \times I_n$  at  $I_n > 2.5 V$ 
  - Rated uninterrupted current 1 A
  - Rated uninterrupted current 1.6 A
  - Rated uninterrupted current 2.5 A
  - Rated uninterrupted current 4 A
  - Rated uninterrupted current 6.3 A

##### Bridging links

##### Accessories

8WA1 822-7EF16

8WA1 822-7EF16

8WA1 891

8WA1 891

##### G fuse links

- IEC 60127-2, DIN VDE 0820 Part 22
- Rated insulation voltage 250 V

##### Versions

- Quick, high breaking capacity: 1.5 kA
  - Rated uninterrupted current 1 A
  - Rated uninterrupted current 1.6 A
  - Rated uninterrupted current 2.5 A
  - Rated uninterrupted current 4 A
  - Rated uninterrupted current 6.3 A
- Slow, low breaking capacity: 35 A at  $I_n \leq 2.5 A$ ,  $10 \times I_n$  at  $I_n > 2.5 V$ 
  - Rated uninterrupted current 1 A
  - Rated uninterrupted current 1.6 A
  - Rated uninterrupted current 2.5 A
  - Rated uninterrupted current 4 A
  - Rated uninterrupted current 6.3 A

##### Bridging links

- 2 mm × 25 mm
- Rated uninterrupted current 16 A (when using the bridging link)
- Rated insulation voltage 800 V

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WA Insta or three-tier terminals

#### Overview

The Insta terminals incorporate up to 3 different terminal functions in one enclosure of 6.2 mm width. Only two terminals are required to set up a complete three-phase outgoing line (L<sub>1</sub>, L<sub>2</sub>, L<sub>3</sub>, PE/ground, N), and each phase can be bridged and multiplied by the 3 cross connection links. The dimensions comply with the requirements for mounting distribution boards in public buildings. The neutral busbar has a different height to the neutral isolating terminals; the 16 mm<sup>2</sup> 8WA2 011-3JG11 or 8WA2 846 feeder terminal is used for the infeed.

#### PE, L, NT Insta terminal

The 8WA2 011-3JG10 terminal is the basic version for AC circuits. It comprises:

- Protective conductor connection
- Through-type connection for one phase conductor (L<sub>1</sub>)
- Neutral conductor connection which can be isolated from the 10 mm × 3 mm neutral busbar by means of a slide.

A complete three-phase outgoing line requires an additional 8WA2 011-3JG12 (L<sub>2</sub>, L<sub>3</sub>) terminal. The three-phase feeder can be multiplied by means of the linking system described below.

#### PE, L, N Insta terminals

If no neutral isolation is required, the 8WA2 011-3JG17 terminal is used:

- Protective conductor connection
- Through-type connection for one phase conductor
- Through-type connection for the neutral conductor

#### PE, L, L Insta terminal

The design of the 8WA2 011-3JG16 terminal is similar to that of the 8WA2 011-3JG17 terminal; instead of a through-type connection for the neutral conductor, a through-type connection for a second phase conductor has been provided.

#### L, L Insta terminal

The 8WA2 011-3JG15 and 8WA2 011-3JG18 terminals respectively include one and two through-type connections for phase conductors.

Example strip fitted with Insta terminals

### Terminal size 4 mm<sup>2</sup>

8WA2 011-3JG10

#### Insta/three-tier terminals, terminal size 4 mm<sup>2</sup>

- Rated uninterrupted current 32 A
- Rated insulation voltage:
  - 400 V between phase conductors
  - 250 V between phase conductors, PE terminal and neutral isolating terminal
- Mounting width 6.2 mm
- Terminal height 28 mm
- Terminal length 116.7 mm
- UL AWG 28-12

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

8WA initiator/actuator terminals

### Overview

- Fast and cost-effective connection from signal transmitters to the PLC
- Only 5 mm wide but still fitted with connection option for proximity switches with up to three conductors plus shielding
- Connection is clear, simple and safe due to:
  - Front connection
  - Color coding of clamping points
  - Conductors from only 0.08 to 1.5 mm<sup>2</sup> without end sleeves that are secured using spring-loaded terminals
- LEDs make the switch states or the application of voltage visible, it is no longer necessary to test with measuring instruments
- Connection modules cut wiring requirements and time because the potentials of the terminals (L+, L- and S) are automatically connected; there is therefore no need for linking accessories
- The modules contain a feeder terminal and 8 or 17 initiator/actuator terminals and can be snapped or screwed onto 35 mm standard mounting rails

The feeder terminals are fitted with an additional negative outgoing feeder which can be used to supply isolated digital input/output modules. The frame (M) can therefore be bridged by means of the terminals.

Terminals and connection modules (always order as combined unit)

Initiator/actuator terminals with electrically isolated digital input/output modules

# ALPHA FIX Terminal Blocks

## Terminals with Spring-Loaded Connection

### 8WA general technical specifications

#### Technical specifications

##### Continuous load at increased ambient temperatures

8WA2 terminal blocks can be loaded with their full uninterrupted current at ambient temperatures of up to +55 °C. At higher ambient temperatures, a current reduction according to the following formula is required:

$$I_{th2'} = I_{th2} \cdot k$$

$I_{th}$  = Uninterrupted current according to selection tables, relative to the nominal cross-section

$I_{th2'}$  = Uninterrupted current at increased ambient temperature

$k$  = Derating factor according to table

| Ambient temperature | Derating factor $k$ |
|---------------------|---------------------|
| 60 °C               | 0.94                |
| 65 °C               | 0.88                |
| 70 °C               | 0.82                |
| 75 °C               | 0.75                |
| 80 °C               | 0.67                |
| 85 °C               | 0.58                |
| 90 °C               | 0.47                |
| 95 °C               | 0.33                |

The maximum terminal overtemperature of 45 K according to IEC 60947-7-1 and EN 60947-7-1, Part 1, is not exceeded at ambient temperatures up to 100 °C.

##### Standard mounting rails as PEN rails

Only Cu busbars must be used.

They must have the same current carrying capacity as protective conductor busbars.

PEN busbars must carry only terminals, and no devices.

##### Standard mounting rail as protective conductor busbar

Protective conductors with a larger cross-section than the protective conductor busbar and with the same conductivity can be connected to standard mounting rails that are also protective conductor busbars and carry current only under fault conditions.

| Standard mounting rail acc. to IEC 60715 TH35 | Material          | Type     | Max. permissible cross-section of connected protective conductor<br>mm <sup>2</sup> |

<sup>1)</sup> 8WA2 803 operating device.

<sup>2)</sup> 8WA2 806 operating device.

##### Rated impulse withstand voltage of terminal blocks

Values depend on the mains rated voltage ≤ rated insulation voltage of terminal block; excerpt from EN 60947-1, table H.1.

Terminal blocks are tested to overvoltage category III.

| Rated mains voltage<br>(≤ Rated insulating voltage of the device)<br>RMS value<br>V AC | Highest rated operational voltage to ground<br>RMS value<br>V AC or DC | Preferred values for rated impulse withstand voltage as 1.2/50 μs-pulse<br>Overvoltage category |          |           |          |

<sup>1)</sup> Only the main terminal types are listed here. You will find further versions on the following pages.

#### Rated short-time withstand current

Our combination plug-in terminals are able to withstand a rated short-time current corresponding to a current density of 120 A/mm<sup>2</sup> specific to the nominal cross-section for a duration of one second.

#### Space-saving design

The special spring provides a large connection compartment in spite of the space-saving design. Flexible conductors with a nominal cross-section of 4 mm<sup>2</sup> can therefore be easily secured without end sleeve in the base terminal and in the plug connector.

#### High-performance contact

The plug-in system of the combination plug-in terminals, which has been further refined, allows plug-in connections for a rated current of up to 32 A and a rated voltage of 800 V. The contact system withstands extreme vibration thanks to the integral over-spring.

# ALPHA FIX Terminal Blocks

## Combination Plug-In Terminals

### Introduction

#### Fingerproof design

With its fingerproof base terminals and plugs, the combination plug-in terminal system provides maximum user protection. As well as enhancing safety, this provides exceptional flexibility during configuration: the power can be supplied either through the terminals or the plugs.

#### Time and cost-saving potential distribution

When feeding in large cross-sections, the reducing comb enables time and cost-saving distribution of the potential. The reducing comb can be used (for example) to connect a 10 mm<sup>2</sup> through-type terminal with a 2.5 mm<sup>2</sup> through-type terminal and two clamping points.

#### Standardized connecting comb system

The standardized connecting comb system allows up to 50 terminals to be connected efficiently and quickly with a single jumper. Teeth can be removed to skip individual terminals.

#### Universal plug-in zone

The universal plug-in zone of the isolating terminal can accommodate isolated through-type connectors, isolating plugs, component connectors and fused connectors.

# ALPHA FIX Terminal Blocks

## Combination Plug-In Terminals

### Introduction

#### Assembling test adapters

Test adapters are available for Ø 4 mm test and safety test plugs. Test adapters can be individually assembled, thanks to the modular design of the test plugs. Test leads can be connected over a 1.5 mm<sup>2</sup> spring-loaded terminal.

#### Coding the combination plug-in terminals

The combination plug-in terminals can be coded with the pin on the plug. The pin is simply removed from the plug, rotated and fitted in the coding position of the base terminal.

#### Snap-on strain relief

Snap-on clamps are available to relieve cable strain at the plugs. Latches are also available to secure the plugs firmly to the base terminals.

# ALPHA FIX Terminal Blocks

## Combination Plug-In Terminals

### 8WH5 through-type terminals

#### Overview

Plugs can be connected at both sides of the terminal using the through-type terminals of the combination plug-in terminals. This makes the combination plug-in terminal system even more flexible and allows the terminals to be used as connecting elements between modules.

Plugs with a terminal size of 2.5 mm<sup>2</sup> enable the use of common accessories, such as latches, strain relief and shield connectors.

PE terminals with the same contour are available for the base terminals. These are simply snapped onto the support rail to establish a connection to ground potential.

## Combination Plug-In Terminals

### 8WH5 hybrid through-type terminals

#### Overview

The hybrid through-type terminals provide a modular solution for fast, flexible wiring of plants and machines. They combine the advantages of the combination terminal system with those of spring-loaded terminals.

#### Technical specifications

# ALPHA FIX Terminal Blocks

## Combination Plug-In Terminals

### 8WH5 hybrid two-tier terminals

#### Overview

With the two voltage levels routed through two separate tiers, the combination two-tier plug-in terminals require 50 % less space than equivalent single-tier terminals. To implement a wide range of switching tasks, connecting combs can be fitted to both tiers of the combination two-tier plug-in terminals.

## Combination Plug-In Terminals

### 8WH5 hybrid isolating blade terminals

#### Overview

Through-type terminals with isolating blade capability are the most commonly used terminal types in instrumentation and control. Key features of the hybrid isolating blade terminals are their narrow width of only 5.2 mm and their high current carrying capacity of 16 A. Ø 2.3-mm test plugs can be fitted on both sides of the isolating point. A special feature of this terminal type is its three bridge slots: the two slots that all the combination plug-in series have in common and an extra one on the other side of the isolating point.

The isolating blade is secured to the terminal so that it cannot be lost.

#### Technical specifications

## Combination Plug-In Terminals

### 8WH5 hybrid isolating terminals

#### Overview

Through-type terminals with isolating point are the most commonly used terminal types in instrumentation and control. The isolating point can accommodate through-type connectors, isolating plugs, component connectors and fused connectors. The isolating terminals excel with their narrow width of only 5.2 mm and their high current carrying capacity of 16 A. Ø 2.3-mm test plugs can be fitted on both sides of the isolating point. A special feature of this terminal type is its three bridge slots.

The slim 5.2 mm isolating terminal with terminal size 2.5 mm<sup>2</sup> is a base terminal and is used for holding:

- Isolating plugs
- Through-type connectors
- Fused connectors
- Component connectors

# ALPHA FIX Terminal Blocks

## Combination Plug-In Terminals

### 8WH9 plug-in connectors

#### Overview

Assembled by the user in-situ from single-pin elements, the plug-in connectors in kit form provide a custom solution for every task.

The basic single-pole connector elements are available in the colors gray, blue and green-yellow.

#### Design

Example of a 6-pin connector

The required number of single-connector elements and one cover are needed for each multi-pole connector. The individual elements and the cover are simply pushed together and latched with securing pins.

When assembling connectors for direct installation, an element with securing pins should be fitted at each end of the connector. For longer connectors, it is advisable to use an element with securing pins for at least every sixth element.

To ensure that the elements engage securely, the holes must be burr-free.

# ALPHA FIX Terminal Blocks

## Combination Plug-In Terminals

8WH9 plugs

### Overview

Assembled by the user in-situ from single-terminal elements, the combination plug-in connectors in kit form provide a custom solution for every task.

For existing plugs with terminal sizes 2.5 mm<sup>2</sup> and 4 mm<sup>2</sup>, and the plug with comb connection and terminal size 2.5 mm<sup>2</sup>, there are single-pole elements available in the colors gray, blue and green-yellow.

### Design

Example of a 6-pin plug

A left and a right element are needed for the two ends of the assembled connector for each multi-pin plug. The number of middle elements depends on the plug's required number of poles. The individual elements are simply pushed together and latched with securing pins.

<sup>1)</sup> Only the main terminal types are listed here. You will find further versions on the following pages.

#### Rated short-time withstand current

Our plug-in terminals are able to withstand a rated short-time current corresponding to a current density of 120 A/mm<sup>2</sup> specific to the nominal cross-section for a duration of one second.

# ALPHA FIX Terminal Blocks

## Plug-In Terminals

### 8WH through-type terminals

#### Overview

All types of conductors can be used with the 8WH4 plug-in terminals.

Rigid conductors and crimped flexible conductors are plugged directly into the terminal.

Flexible, untreated conductors can be connected using a screw-driver.

These terminals can be used interconnected with the neutral busbar 10 × 3 mm.
