

Presenting our Lateral Systems

Little did we know

when we introduced our first holdown in 1966 that our product innovations would lead us to solutions that can help hold together five-story buildings during an earthquake or allow builders to install larger window and door openings in homes. Our offering of lateral-force resisting systems, including Wood and Steel Strong-Wall[®] shearwalls, Anchor Tiedown Systems and new Strong Frame™ moment frames, gives designers and engineers added design flexibility in wood-frame construction and the confidence that almost anything is possible.

At Simpson Strong-Tie, we believe that strength really does come in numbers. By offering the largest selection of lab and field-tested lateral-force resisting systems along with dedicated engineers and field support reps to back them up, you can count on the strength of our products and our people to perform.

Whether you're designing or building a single-family home, a six-story mixed-used building or a retail store, we know we have a solution to fit your project and meet the most stringent code requirements. And we're not done yet. The research, testing and

structural system technology that's to come has us just as excited as we were when we developed that first holdown. With each new product and design innovation, we're working with the industry to increase the structural safety of homes and buildings around the country. And in light of all the hurricanes and earthquakes we've experienced during the last 40 years, that's a pretty good feeling.

KEEP THIS CATALOG – IT IS NOW VALID FOR TWO YEARS

Simpson Strong-Tie will now publish its *Wood Construction Connectors* catalog every two years. In an effort to continue to provide our customers with current information on our ever-expanding product line, we will be publishing an addendum on years we don't print a catalog. The addendum will contain new product information, updated testing information and any other information needed to keep our customers up to date with our product line. As always, please be sure to visit our website regularly for updates that occur throughout the year — *www.strongtie.com*.

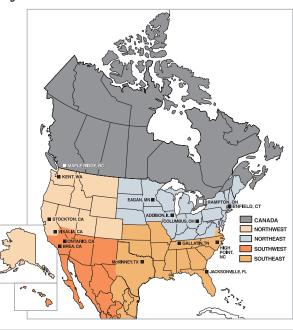

INTRODUCTION

For more than 50 years, Simpson Strong-Tie has focused on creating structural products that help people build safer and stronger homes and buildings. A leader in structural systems research and technology, Simpson is one of the largest suppliers of structural building products in the world. Simpson's commitment to product development, engineering, testing and training is evident in the consistent quality and delivery of its products and services. Simpson Strong-Tie® product lines include structural connectors, Strong-Wall® prefabricated shearwalls, Anchor Tiedown Systems for multi-story buildings, Quik Drive® auto-feed screw driving systems and Simpson Strong-Tie Anchor Systems® anchors and fasteners for concrete and masonry. For more information, visit the company's Web site at **www.strongtie.com**.

The Simpson Strong-Tie Company Inc. "NO EQUAL" pledge includes:

- · Quality products value-engineered for the lowest installed cost at the highest rated performance levels.
- · Most thoroughly tested and evaluated products in the industry.
- · Strategically-located manufacturing and warehouse facilities.
- · National Code Agency listings.
- · Largest number of patented connectors in the industry.
- European locations with an international sales team.
- In-house R&D, and tool and die professionals.
- In-house product testing and quality control engineers.
- Member of AITC, ASTM, ASCE, AWPA, ACI, AISC, CSI, ICFA, NBMDA. NLBMDA. SETMA. STAFDA, SREA, NFBA, WTCA and local engineering groups.

THE SIMPSON STRONG-TIE QUALITY POLICY

We help people build safer structures economically. We do this by designing, engineering and manufacturing "No Equal" structural connectors and other related products that meet or exceed our customers' needs and expectations. Everyone is responsible for product quality and is committed to ensuring the effectiveness of the Quality Management System.

Chief Executive Officer

Terry Kingsfather

President

GETTING FAST TECHNICAL SUPPORT

When you call for engineering technical support, we can help you guickly if you have the following information at hand. This will help us to serve you promptly and efficiently.

- · Which Simpson Strong-Tie catalog are you using? (See the front cover for the catalog number)
- Which Simpson Strong-Tie product are you using?
- · What is your load requirement?
- · What is the carried member's width and height?
- · What is the supporting member's width and height?
- What is the carried and supporting members' material and application?

WE ARE ISO 9001-2000 REGISTERED

Simpson Strong-Tie is an ISO 9001-2000 registered company. ISO 9001-2000 is an internationally-recognized quality assurance system which lets our domestic and international customers know that they can count on the consistent quality of Simpson Strong-Tie products and services.

800-999-5099 | www.strongtie.com

CONNECTOR SELECTION KEY

Products are divided into fifteen general categories, identified by tabs along the page's outer edge.

Fasteners & Quik Drive® Systems	16-20
Concrete Connectors & Anchors	21-36
Holdowns & Tension Ties	37-46
Caps & Bases	47-56
Lateral Systems	57-59
Solid Sawn Lumber Connectors	60-79
Engineered Wood & Structural Composite Lumber Connectors	80-110
Glulam Beam Connectors	111-116
Plated Truss Connectors	117-138
Masonry Connectors	139-147
Straps & Ties	148-164
Decks & Fences	165-168
Miscellaneous	169-175
Architectural Products Group	176-180
Hanger Options	181-190

MASA Mudsill Anchor

MAS mudsill anchors have always been a time-saving alternative to mudsill anchor bolts, and now the new and improved design of the MASA provides for one-to-one replacement of ½" and %" anchor bolts. Additional fasteners and the reinforcement of key sections of the anchor have improved performance so that the load capacity of the MASA mudsill anchor either meets or exceeds that of other cast-in-place anchors. Since the MASA can be installed as wide as 6' on center, the same load capacity can be achieved with fewer mudsill anchors.

See pages 22-23 for details

FWANZ Foundation Wall Angle

The new FWANZ foundation angle performs the same function as the original FWAZ: anchoring foundation and basement walls to the floor system to resist lateral loads due to soil pressure. Whereas the FWAZ utilizes the Titen HD screw anchor for anchorage, the new FWANZ fastens to the sill plate with nails and utilizes independent anchorage (by Designer) into the wall. This connection is called out in both the International Building Code® (IBC) Section 1610.1 and International Residential Code® Section R404.

See page 25 for details

HTT4 & HTT5 Tension Ties

The LTT/MTT/HTT series of tension ties offers tension-resisting solutions that install with nails. These new additions to the HTT line feature an optimized nailing pattern which results in better performance with less deflection. Designed to meet new code standards, the HTT4 and HTT5 offer higher loads than their predecessors the HTT16 and HTT22. For an added benefit, the HTT5 installs with 6 fewer nails than the HTT22.

See page 40 for details

HD19 Holdown

The new HD19 sits at the top of the holdown family when it comes to load values. With a maximum load of over 19,000 lbs. this high-capacity bolted holdown is ideal for applications that exceed the capacity of our other holdowns such as the HDU series. They are self-jigging on the stud, ensuring that the code-required seven-bolt-minimum end distance is maintained.

See page 41 for details

NEW PRODUCTS FOR 2009

DTT2Z Deck Tension Tie

The new DTT2Z is a safe, cost-effective way to attach deck-railing posts to the deck framing. Because the post is tied back into the deck joists, rather than to the rim joist alone, the connection is stronger than typical through-bolt installations and complies with new standards regarding guardrail post connections for decks. The DTT2Z also complies with the new standards for reinforcing the connection of the deck to the house. Additionally the versatile DTT2Z is load rated as a holdown for light-duty shearwalls and braced-panel applications.

See page 165 for details

DETAL Embedded Truss Anchor

The new DETAL high-capacity embedded truss anchor attaches single-ply roof trusses to concrete and masonry walls. The DETAL20 combines dual embedded anchors with a structural moisture-barrier seat that is partially embedded in the concrete or grout. This plate serves to protect the truss and also provides increased lateral and uplift capacity.

See pages 144-145 for details

TBD Truss Brace

Everything about the new TBD truss brace is designed to make diagonal truss bracing easier. It travels in a box like a coiled strap and is formed into shape as it is pulled from the carton, making it rigid and easy to position across trusses. Once fastened into place, the braces lay flat so that they remain in place as the roof is sheathed, eliminating the need to remove bracing. And since the braces stay in place, trusses maintain better alignment and are safer for sheathing crews to work on.

See page 133 for details

General Purpose Angles & Straps

Simpson Strong-Tie introduces three new products to handle those applications where you need a versatile general-purpose connector. The MLZ angles are 4" and 6" long angles that fasten with Simpson Strong-Tie® Strong-Drive® screws (SDS) for a solid connection. The HTP37Z is a 3"x7" strap that installs with 10dx1½" nails and the HRS416Z is a heavy-duty 4"x16" strap that installs with SDS screws for added strength.

See pages 148-149 (HTPZ & HRSZ), 167 (MLZ) for details

HOW TO USE THIS CATALOG

SIMPSON

NEW PRODUCTS

New products are shown with the @ symbol. There are also many new sizes within existing model series.

CHANGES IN RED

Significant changes from last year's catalog are indicated in red.

VALUE ENGINEERED

This icon indicates a product that is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

product name.

EXTRA CORROSION PROTECTION

This icon identifies products that are available with additional corrosion protection (ZMAX®, Hot-Dip Galvanized, stainless steel or the SDS double-barrier coating). Other products may also be available with additional protection, contact Simpson Strong-Tie for options. The end of the product name will indicate what type of extra corrosion protection is provided (Z = ZMAX, HDG = Hot-Dip Galvanizedor SS = stainless steel). See page 10-11 for information on corrosion, and visit our website www.strongtie.com/info for more technical information on this topic.

HOW WE DETERMINE ALLOWABLE LOADS

Allowable loads in this catalog are determined using calculations and/or one or more of the following methods:

- . a minimum of 3 static load tests in wood assemblies:
- · a minimum of 3 static load tests in steel jigs;
- a minimum of 3 static load tests of products embedded in concrete or masonry.

Where available, testing is performed to test criteria established by industry (ASTM or ICC-ES Acceptance Criteria) or if unavailable testing is per sound engineering principles. Some tests include only portions of a product such as purlin anchor tests—only the embedded hook is tested, not the nailed or bolted section of the strap, which is calculated. Testing to determine allowable loads in this catalog is not done on connection systems in buildings. Testing is conducted under the supervision of an independent laboratory. Typically the allowable load is limited to the lowest of 1/8" deflection, test ultimate/3 or calculation value.

For detailed information regarding how Simpson Strong-Tie tests specific products, contact Simpson Strong-Tie.

Allowable Design Loads: The CATALOG DEFINITION: maximum load that a connection Deflection: The distance a point is designed to provide. There may moves when a load is applied. be multiple design loads acting in different directions (up, down, lateral, perpendicular, etc.) imposed on a connection. Dimensions W, L, H: This shows the product dimensions (width, length and height in this case) referenced in the product drawing

Throughout this catalog a footnote will typically be provided indicating the required nail diameter and length.

All installations should be designed only in accordance with the allowable load values set forth in this catalog.

CORROSION INFORMATION

Understanding the Issues

Metal connectors, anchors, and fasteners will corrode and may lose loadcarrying capacity when installed in corrosive environments or exposed to corrosive materials. There are many environments and materials which may cause corrosion including ocean salt air, fire retardants, fumes, fertilizers, preservative-treated wood, dissimilar metals, and other corrosive elements.

The many variables present in a single building environment make it impossible to accurately predict if, or when, significant corrosion will begin or reach a critical level. This relative uncertainty makes it crucial that specifiers and users be knowledgeable of the potential risks and select a product coating or metal suitable for the intended use. It is also important that regular maintenance and periodic inspections are performed, especially for outdoor applications.

It is common to see some corrosion on connectors especially in outdoor applications. Even stainless steel can corrode. The presence of some corrosion does not mean that load capacity has necessarily been affected or that a failure will occur. If significant corrosion is apparent or suspected, then the wood, fasteners and connectors should be inspected by a professional engineer or general contractor and may need to be replaced.

In the last several years, preservative-treated wood formulations have changed significantly. Many of the new formulations are more corrosive to steel connectors and fasteners than the traditionally used formulation of CCA-C Simpson Strong-Tie testing has shown that ACQ-C, ACQ-D (Carbonate), CBA-A and CA-B treated woods are approximately 2 times more corrosive than CCA-C, while SBX-DOT (Sodium Borate) treated woods were shown to be less corrosive than CCA-C. Refer to technical bulletin T-PTWOOD for more information (see page 191 for details).

Due to the many different preservative formulations, fluctuating retention levels, moisture content, and because the formulations may vary regionally, or change without warning, understanding which connectors and fasteners to use with these materials has become a complex task. We have attempted to provide basic knowledge on the subject here, but it is important to fully educate yourself by reviewing our technical bulletins on the topic, and also by viewing information and literature provided by others. This information pertains to Simpson Strong-Tie® connectors only. For corrosion information on other product lines, such as fasteners, see the specific Simpson Strong-Tie product line catalogs. Additionally, because the issue is evolving, it is important to get the very latest connector information on the topic by visiting our website at www.strongtie.com/info.

Stainless steel is always the most effective solution to corrosion risk. However, it is also more expensive and sometimes more difficult to obtain. To best serve our customers, Simpson Strong-Tie is evaluating the options to identify the safest and most cost-effective solutions. Based on our testing and experience there are some specific applications that are appropriate for ZMAX/HDG or G90 connectors (see chart on page 11.)

Because increased corrosion from some newer preservative-treated wood is a new issue with little historical data, we have to base our recommendations on the testing and experience we have to date. It is possible that as we learn more, our recommendations may change, but these recommendations are based on the best information we have at this time.

CORROSION INFORMATION

General Simpson Strong-Tie Recommendations

- Outdoor environments are generally more corrosive to steel. If you choose
 to use ZMAX® or HDG finish on an outdoor project (i.e. deck, patio cover),
 you should periodically inspect your connectors and fasteners or have a
 professional inspection performed. Regular maintenance including waterproofing of the wood used in your outdoor project is also a good practice.
- For wood with actual retention levels greater than 0.40 pcf for ACQ and MCQ, 0.41 pcf for CBA-A, or 0.21 pcf for CA-B (Ground Contact), stainless-steel connectors and fasteners are recommended. Verify actual retention level with the wood treater.
- When using stainless-steel connectors, use stainless-steel fasteners.
 When using ZMAX/HDG galvanized connectors, use fasteners that meet the specifications of ASTM A153.
- Testing indicates wood installed dry reduces potential corrosion. If dry wood is used, see our website for additional information.
- Using a barrier membrane can provide additional corrosion protection, see technical bulletin T-PTBARRIER (see page 191 for details).

Due to the many variables involved, Simpson Strong-Tie cannot provide estimates on service life of connectors, anchors or fasteners. We suggest that all users and Designers also obtain recommendations for HDG, ZMAX (G185), mechanically galvanized, or other coatings from the treated wood supplier for the type of wood used. However, as long as Simpson Strong-Tie recommendations are followed, we stand behind product performance and our standard warranty (page 15) applies.

Guidelines for Selecting the Proper Connector

1 Evaluate the Application.

Consider the type of structure and how it will be used. These recommendations may not apply to non-structural applications such as fences.

2 Evaluate the Environment.

Testing and experience indicate that indoor dry environments are less corrosive than outdoor environments. Determining the type of environment where a connector or fastener will be used is an important factor in selecting the most appropriate material and finish for use on the connectors and fasteners. To help in your decision making, consider the following general exposure information:

Interior Dry Use: Includes wall and ceiling cavities, and raised floor applications of enclosed buildings that have been designed to ensure that condensation and other sources of moisture do not develop.

Exterior – Dry: Includes outdoor installations in low rainfall environments and no regular exposure to moisture.

Exterior – Wet: Includes outdoor installations in higher moisture and rainfall environments.

Higher Exposure Use: Includes exposure to ocean-salt air, fire retardants, large bodies of water, fumes, fertilizers, soil, some preservative-treated woods, industrial zones, acid rain, and other corrosive elements. Type 316 stainless steel contains slightly more nickel than other grades, plus molybdenum, giving it better corrosion resistance in high-chloride environments.

3 Evaluate and select a suitable preservative-treated wood for the intended application and environment.

The treated wood supplier should provide all the information needed regarding the wood being used. This information should include: the specific type of wood treatment used, if ammonia was used in the treatment, and the chemical retention level. If the needed information is not provided then Simpson Strong-Tie would recommend the use of stainless-steel connectors and fasteners. You should also ask the treated-wood supplier for a connector coating or material recommendation.

Use the chart on the right, which was created based on Simpson Strong-Tie testing and experience to select the connector finish or material.

If a preservative-treated wood product is not identified on the chart, Simpson Strong-Tie has not evaluated test results regarding such product and therefore cannot make any recommendation other than the use of stainless steel with that product. Manufacturers may independently provide test results or other product use information; Simpson Strong-Tie expresses no opinion regarding any such information.

Compare the treated-wood supplier's recommendation with the Simpson Strong-Tie recommendation.

If these recommendations are different, Simpson Strong-Tie recommends that the most conservative recommendation be followed.

Simpson Strong-Tie recommendations are as follows:

- Low = Use standard painted and G90 galvanized connectors, or Simpson Strong-Tie® Strong-Drive® screws (SDS) with the double-barrier coating, as a minimum.
- Med = Use ZMAX/HDG galvanized connectors as a minimum. Use HDG fasteners which meet the specifications of ASTM A153 or Simpson Strong-Tie® Strong-Drive® screws (SDS) with double-barrier coating.

High⁶ = Use Type 303, 304, 305 or 316 stainless-steel connectors and fasteners.

CONNECTOR COATING RECOMMENDATION - STRUCTURAL APPLICATIONS ACQ-C, ACQ-D (Carbonate), CA-B & CBA-A DOT Untreated **Environment** MCQ ACZA Higher Wood No With Zinc Uncertai Chemica Ammonia Ammoni **Borate** Content Interior - Dry Low Low Med⁵ Med High High High Low Exterior - Dry N/A2 Med Hiah Hiah Hiah Low Med High Exterior - Wet Med N/A2 Med3,4 Med3,4 High High High High Higher Exposure N/A² High High High High Hiah High Hiah High High High Uncertain Hiah N/A2 High High High

- 1. Woods with actual retention levels greater than 0.40 pcf for ACQ and MCQ, 0.41 pcf for CBA-A, or 0.21 pcf for CA-B (Ground Contact level).
- 2. Borate treated woods are not appropriate for outdoor use.
- Test results indicate that ZMAX/HDG and the SDS double-barrier coating will
 perform adequately, subject to regular maintenance and periodic inspection.
 However, the nationally-approved test method used, AWPA E12-94, is an
 accelerated test, so data over an extended period of time is not available.
 If uncertain, use stainless steel.
- Some treated wood may have excess surface chemicals making it potentially
 more corrosive. If you suspect this or are uncertain, use stainless steel.
 Where noted in the table, applications where the wood is dry (moisture)
- Where noted in the table, applications where the wood is dry (moisture content less than 19%) when installed and will remain dry in-service may use a minimum coating recommendation of "Low".
- Type 316 stainless-steel connectors and fasteners are the minimum recommendation for ocean-salt air and other chloride environments.

COATINGS AVAILABLE

Not all products are available in all finishes.

Contact Simpson Strong-Tie for product availability, ordering information and lead times.

Finish/Material	Finish/Material Description	
Gray Paint	Water-based paint intended to protect the product while it is warehoused and in transit to the jobsite.	Low
Powder Coating	Baked on paint finish that is more durable than our standard paint and produces a better looking finished product.	Low
Standard G90 Zinc Coating	Zinc galvanized coating containing 0.90 oz. of zinc per square foot of surface area (total both sides).	Low
Galvanized (G185) 1.85 oz. of zinc per square foot of surface area (hot-dip galvanized per ASTM A653 total both sides). These products require hot-dip galvanized fasteners (fasteners which meet the specifications of ASTM A153).		Medium
HOTPIPD (G GALVANIZED*	Products are hot-dip galvanized after fabrication (14 ga. and thicker). The coating weight increases with material thickness. The minimum specified coating weight is 2.0 oz./ft² (per ASTM A123 total both sides). These products require hot-dip galvanized fasteners (fasteners which meet the specifications of ASTM A153).	Medium
Double-Barrier Coating (SDS Screws) Simpson Strong-Tie Strong-Drive screws (SDS) that are manufactured with two different finishes that provide a level of corrosion protection that exceeds that provided by the previous HDG coating. Connectors are manufactured from Type 316L stainless steel, and provide greater durability against corrosion. Stainless-steel nails are required with stainless-steel products, and are available from Simpson Strong-Tie.		Medium
		High

CODES

Code Reference Column in Load Tables

The alpha-numeric "Code Reference numbers" that appear in the "Code Reference" column in load tables throughout this catalog are intended to identify products listed in evaluation agency reports, typically called "code reports", and the specific reports that cover them. The letter designates which evaluation agency from which the report was obtained. The Code reference column, used in conjunction with the chart at right, indicates which code listing applies to a product. The reference numbers also clearly identify:

- Products submitted for evaluation report listing (160)
- Products with no evaluation report listing (170)
- Products not submitted because they have no load rating and an evaluation report listing is not necessary (180)
- Products that meet prescriptive or conventional construction code requirements (190)

Where a model has been submitted for listing (160) or does not have an evaluation report listing (170), Simpson Strong-Tie can supply complete test data to support our published loads. Please contact us for a copy of our product test documentation at (800) 999-5099. Product acceptance may be obtained through the Alternate Methods and Materials section of the applicable building code.

Some loads and applications may not be covered in the code report and specific reductions and restrictions may be required by other product evaluation agencies. Visit **www.strongtie.com** or visit the product evaluation agencies' web sites for the current evaluation reports.

Simpson Strong-Tie® connectors are recognized by most product evaluation agencies. Agencies that recognize some or all of our products include ICC-ES (formerly ICBO, BOCA, SBCCI); IAPMO ES; the City of Los Angeles, California; and State of Florida.

Multiple types of ICC-ES evaluation reports are shown in the Code Reference Key Chart. ICC-ES NER, ICC-ES ER, and ICC-ES ES reports are referred to as Legacy Reports and have been obtained over the years to verify that Simpson Strong-Tie products are in compliance with the code. These Legacy reports were evaluated under the 1997 UBC and/or the 2000 IBC codes. In order to obtain evaluation for the 2003 or 2006 I-codes, manufacturers must submit for ICC-ES ESR reports.

Simpson has many ICC-ES ESR reports, but currently not all products have been evaluated per the latest codes. This does not mean that the information in those reports is inaccurate. Simpson has submitted our Legacy Reports to ICC-ES to obtain product evaluation service reports (ESR's) evaluated using the 2006 IBC/IRC, but due to the large number of reports they have to evaluate and new acceptance criteria (AC) that have only recently been adopted, ICC-ES has not been able to process all the reports in time for this catalog.

It is anticipated that during the first and second quarter of 2009, our remaining Legacy Reports will be converted. To help understand which of our stamped and welded connector products are listed in an ESR report, we have obtained an ICC-ES index evaluation services report, ICC-ES ESR-2523, for these products. This report is a reference document to other ESR reports held by Simpson Strong-Tie and will be updated frequently by ICC-ES as new stamped and welded connector evaluation services reports are issued or converted. Please visit **www.strongtie.com** for the latest information or contact ICC Evaluation Services at **www.icc-es.org**.

IAPMO Evaluation Service has been evaluating products for over 80 years and has the same ANSI accreditation as ICC Evaluation Services for evaluating structural building products to the building codes. IAPMO ES began evaluating structural building products in 2004, utilizing licensed structural engineers to perform quality reviews, and currently are reviewing many other manufacturers' products. Please visit www.strongtie.com for the latest information or contact IAPMO Evaluation Services at www.iapmoes.org.

In November 2007 the Department of State Architecture, California, issued a revised IR 23-1. The Revised Interpretation of Regulation addresses and clarifies issues relating to Pre-fabricated Wood Construction Connectors. IR 23-1 defines the Purpose and Scope and clarifies Listing Requirements, Acceptable Load Capacities, Design Requirements, Installation Requirements and Connector Fabrication which addresses corrosion resistant material and/or coatings. Please contact the DSA at www.dsa.dgs.ca.gov/Publications/default.htm for more information.

On September 20, 2007, the City of Los Angeles, *www.ladbs.org*, revised its policy to permit products with evaluation reports from other evaluation agencies with the exception of those products resisting seismic forces. Products resisting seismic forces must be listed in a Los Angeles Research Report (LA RR).

On October 1, 2003, the State of Florida's Statewide Product Approval System became effective. The purpose of this system is to provide a single product evaluation and approval system that applies statewide to operate in coordination with the Florida Building Code. This Florida product evaluation and approval system is governed by Florida Statutes, Chapter 553, Section 553.842. Since this law specifies that the product approval system is to apply statewide, Notice of Acceptance are no longer necessary where a product has a statewide approval that is applicable in the High Velocity Hurricane Zone (HVHZ) and is installed in accordance with its conditions of use.

* As of the printing of this catalog, products coded 160 either have been submitted and are awaiting issuance from the respective product evaluation agency or are to be submitted. Because code reports can be issued throughout the year, we encourage the user to visit www.strongtie.com, www.icc-es.org, www.ladbs.org, www.dsa.dgs.ca.gov, and www.floridabuilding.org for the most current information, call Simpson Strong-Tie at 800-999-5099, or contact the code agency directly.

WARNING

Simpson Strong-Tie Company Inc. structural connectors, anchors, and other simpson Strong-Tie Company Inc. Structural connectors, anchors, and other products are designed and tested to provide specified design loads. To obtain optimal performance from Simpson Strong-Tie Company Inc. products and achieve maximum allowable design load, the products must be properly installed and used in accordance with the installation instructions and design limits provided by Simpson Strong-Tie Company Inc. To ensure proper installation and use, designers and installers must carefully read the following Congret Notes Congret Instructions for The Installar and Geography Instructions General Notes, General Instructions For The Installer and General Instructions For The Designer, as well as consult the applicable catalog pages for specific product installation instructions and notes

Proper product installation requires careful attention to all notes and instructions, including these basic rules:

- 1. Be familiar with the application and correct use of the connector.
- Follow all installation instructions provided in the applicable catalog, website, Installer's Pocket Guide or any other Simpson Strong-Tie publications.
 Install all required fasteners per installation instructions provided by Simpson
- Strong-Tie Company Inc.: a) use proper fastener type; b) use proper fastener quantity; c) fill all fastener holes; d) do not overdrive or underdrive nails, including when using gun nailers; and e) ensure screws are completely driven.
 4. Only bend products that are specifically designed to be bent. For those products that required bending, do not bend more than once.
 5. Cut joists to the correct length, do not "short-cut". The gap between the end of the joist and the header material should be no greater than 1/s" unless otherwise noted.
- unless otherwise noted

In addition to following the basic rules provided above as well as all notes, warnings and instructions provided in the catalog, installers, designers, engineers and consumers should consult the Simpson Strong-Tie Company Inc. website at **www.strongtie.com** to obtain additional design and installation information, including:

 Instructional builder/contractor training kits containing an instructional video, an instructor guide and a student guide in both English and Spanish;

- Installer's Pocket Guide (form S-INSTALL, see page 191 for details)
 which is designed specifically for installers and uses detailed graphics
 and minimal text in both English and Spanish to explain visually how to install many key products
- Information on workshops Simpson Strong-Tie conducts at various training centers throughout the country;
 Product specific installation videos;
- Specialty catalogs;
- Code reports;
- · Technical fliers and bulletins;
- Master format specifications;
- · Material safety data sheets;
- Corrosion information;
- Connector selection guides for engineered wood products (by manufacturer); Simpson Strong-Tie Connector Selector™ software;

- Simpson Strong-Tie Autocad menu;
 Simpson Strong-Tie Strong-Wall® Selector software;
- Simpson Strong-Tie Anchor Tiedown System Selector and anchor related software; and
- Answers to frequently asked questions and technical topics.

Failure to follow fully all of the notes and instructions provided by Simpson Strong-Tie Company Inc. may result in improper installation of products. Improperly installed products may not perform to the specifications set forth in this catalog and may reduce a structure's ability to resist the movement, stress, and loading that occurs from gravity loads as well as impact events such as earthquakes and high velocity winds.

Simpson Strong-Tie Company Inc. does not guarantee the performance or safety of products that are modified, improperly installed or not used in accordance with the design and load limits set forth in this catalog.

GENERAL NOTES

These general notes are provided to ensure proper installation of Simpson Strong-Tie Company Inc. products and must be followed fully.

- a. Simpson Strong-Tie Company Inc. reserves the right to change specifications, designs, and models without notice or liability for such changes.
- Steel used for each Simpson Strong-Tie® product is individually selected based on the product's steel specifications, including strength, thickness, formability, finish, and weldability. Contact Simpson Strong-Tie for steel information on specific products
- c. Unless otherwise noted, dimensions are in inches, loads are in pounds.
- d. Unless otherwise noted, welds, screws, bolts and nails may not be combined to achieve highest load value. 8d (0.131"x2½"), 10d (0.148"x3"), and 16d (0.162"x3½") specify common nails that meet the requirements of ASTM F1667. When a shorter nail is specified, it will be noted (for example 8dx11/2) Refer to Simpson Strong-Tie Nailing Guide, NDS (National Design Specification) and ASTM F1667 (American Society of Testing and Materials) for more nail info.
- Do Not Overload. Do not exceed catalog allowable loads, which would jeopardize the connection.
- Unless otherwise noted, allowable loads are for Douglas Fir-Larch under continuously dry conditions. Allowable loads for other species or conditions must be adjusted according to the code. In many cases, Simpson Strong-Tie code reports will indicate loads derived from Doug Fir header material only However under ICC-ES AC13, loads for Douglas Fir are the same as LVL, LSL, PSL, Glulam's and Southern Pine, since the specific gravity of these wood species fall within the specific gravity range of the AC13 criteria. The section from the AC13 criteria indicating the range of specific gravity reads as follows: 3.2.3 The species of lumber used shall have a specific gravity not greater than 0.55 as determined in accordance with the NDS. This chart shows specific gravity for the different wood species:

Species	Fc⊥	Specific Gravity
Douglas Fir-Larch (DF)	625 psi	0.50
Southern Pine (SP)	565 psi	0.55
Spruce-Pine-Fir (SPF)	425 psi	0.42
Hem Fir (HF)	405 psi	0.43
Glulam	560 psi	0.50
LVL (DF/SP)	750 psi	0.50
LSL (E=1.3x10 ⁶)	680 psi	0.50
LSL (E≥1.5x10 ⁶)	880 psi	0.50
Parallam® PSL	750 psi	0.50

- g. Simpson Strong-Tie Company Inc. will manufacture non-catalog products provided prior approval is obtained and an engineering drawing is included with the order. Steel specified on the drawings as $\frac{1}{6}$, $\frac{3}{6}$, and $\frac{1}{4}$ will be 11 gauge (0.120"), 7 ga (0.179"), and 3 gauge (0.239"), respectively. The minimum yield and tensile strengths are 33 ksi and 52 ksi, respectively.
- h. All references to bolts or machine bolts (MBs) are for structural quality through bolts (not lag screws or carriage bolts) equal to or better than ASTM Standard A307, Grade A.
- Unless otherwise noted, bending steel in the field may cause fractures at the bend line. Fractured steel will not carry load and must be replaced.
- A fastener that splits the wood will not take the design load. Evaluate splits to determine if the connection will perform as required. Dry wood may

- split more easily and should be evaluated as required. If wood tends to split, consider pre-boring holes with diameters not exceeding .75 of the nail diameter (2005 NDS 11.1.5.3) or use a 5½" bit for SDS screws.
- Wood shrinks and expands as it loses and gains moisture, particularly perpendicular to its grain. Take wood shrinkage into account when designing and installing connections. Simpson Strong-Tie manufactures products to fit common dry lumber dimensions. If you need a connector with dimensions other than those listed in this catalog, Simpson Strong-Tie may be able to vary connector dimensions; contact Simpson Strong-Tie. The effects of wood shrinkage are increased in multiple lumber connections, such as floor-to-floor installations. This may result in the vertical rod nuts becoming loose, requiring post-installation tightening. (Contact Simpson Strong-Tie for information on Takeup Devices.)
- Top flange hangers may cause unevenness. Possible remedies should be evaluated by a professional and include using a face mount hanger, and routering the beam or cutting the subfloor to accommodate the top flange thickness.
- m. Built-up lumber (multiple members) must be fastened together to act as one unit to resist the applied load (excluding the connector fasteners). This must be determined by the Designer/Engineer of Record.
- n. Some model configurations may differ from those shown in this catalog. Contact Simpson Štrong-Tie for details.
- Hanger Options (Simpson Strong-Tie Hanger Options Matrix and Hanger Option General Notes page 181-183) some combinations of hanger options are not available. In some cases, combinations of these options may not be installable. Horizontal loads induced by sloped joists must be resisted by other members in the structural system. A qualified Designer must always evaluate each connection, including carried and carrying member limitations, before specifying the product. Fill all fastener holes with fastener types specified in the tables, unless otherwise noted. Hanger configurations, height, and fastener schedules may vary from the tables depending on joist size skew and slope. See the allowable table load for the non-modified hanger, and adjust as indicated. Gauge may vary from that specified depending on the manufacturing process used.
- Simpson Strong-Tie will calculate the net height for a sloped seat. The customer must provide the H1 joist height before slope.
- Truss plates shown are not manufactured by Simpson Strong-Tie.
- Do not weld products listed in this catalog unless this publication specifically identifies a product as acceptable for welding, or unless specific approval for welding is provided in writing by Simpson Strong-Tie. Some steels have poor weldability and a tendency to crack when welded. Cracked steel will not carry load and must be replaced. See Simpson Strong-Tie Hanger Options Matrix and Hanger Option General Notes page 181-183 for hangers that may be welded.
- Unless noted otherwise, all references to standard cut washers refer to Type A plain washers (W) conforming to the dimensions shown in ASME B18.22.1 for the appropriate rod size. Some products require SAE narrow washers (N) to fit in a tight space and are noted accordingly.

GENERAL INSTRUCTIONS FOR THE INSTALLER

These general instructions for the installer are provided to ensure proper selection and installation of Simpson Strong-Tie Company Inc. products and must be followed carefully. These general instructions are in addition to the specific installation instructions and notes provided for each particular product, all of which should be consulted prior to and during installation of Simpson Strong-Tie Company Inc. products.

- a. All specified fasteners must be installed according to the instructions in this catalog. Incorrect fastener quantity, size, placement, type, material, or finish may cause the connection to fail. Prior to using a particular fastener, please consult the Fastener Guide in this catalog.
 - 16d fasteners are common nails (0.162" dia. x 3½" long) and cannot be replaced with 16d sinkers (0.148" dia. x 3¼" long) for full load value unless otherwise specified.
 - Unless otherwise noted screws may not be used to replace nails in connectors unless approved and recommended by the Designer/Engineer of Record. Unless stated otherwise, Simpson Strong-Tie cannot and does not make any representations regarding the suitability of use or load-carrying capacities of connectors with screws replacing nails.
 - When using stainless-steel connectors, use stainless-steel fasteners.
 When using ZMAX®/HDG galvanized connectors, use fasteners that meet the zinc coating specifications of ASTM A153 or other fasteners allowed in this catalog.
- b. Fill all fastener holes as specified in the installation instructions for that product. Refer to page 17 for the requirements of the various shapes of fastener hole.
- c. Do not overdrive nails. Overdriven nails reduce shear capacity.
- d. Use the materials specified in the installation instructions. Substitution of or failure to use specified materials may cause the connection to fail.
- e. Do not add fastener holes or otherwise modify Simpson Strong-Tie Company Inc. products. The performance of modified products may be substantially weakened. Simpson Strong-Tie will not warrant or guarantee the performance of such modified products.
- f. Install products in the position specified in the catalog.
- g. Do not alter installation procedures from those set forth in this catalog.
- h. The proper use of certain products requires that the product be bent. For those products, installers must not bend the product more than one time (one full cycle).
- i. Bolt holes shall be at least a minimum of 1/32" and no more than a maximum of 1/16" larger than the bolt diameter (per the 2005 NDS, section 11.1.2. and AISI NASPEC, section E3a if applicable).
- j. Install all specified fasteners before loading the connection.
- k. Some hardened fasteners may have premature failure if exposed to moisture. These fasteners are recommended to be used in dry interior applications.
- Use proper safety equipment.
- m. Welding galvanized steel may produce harmful fumes; follow proper welding procedures and safety precautions. Welding should be in accordance with A.W.S. (American Welding Society) standards. Unless

- otherwise noted Simpson Strong-Tie® connectors cannot be welded.
- n. Pneumatic or powder-actuated fasteners may deflect and injure the operator or others. Pneumatic nail tools may be used to install connectors, provided the correct quantity and type of nails (length and diameter) are properly installed in the nail holes. Tools with nail hole-locating mechanisms should be used. Follow the manufacturer's instructions and use the appropriate safety equipment. Overdriving nails may reduce allowable loads. Contact Simpson Strong-Tie. Powder-actuated fasteners should not be used to install connectors.
- o. Joist shall bear completely on the connector seat, and the gap between the joist end and the header shall not exceed 1/2" per ICC-ES AC261 and ASTM D7147 test standards (unless specifically noted otherwise).
- p. For holdowns, anchor bolt nuts should be finger-tight plus 1/3 to 1/2 turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken to not over-torque the nut. Impact wrenches should not be used as they may preload the holdown.
- q. Holdowns and Tension Ties may be raised off the sill as dictated by field conditions to accommodate an anchor mislocated no more than 1½". The holdown shall be raised off the sill at least 3" for every ¼" that the anchor is offset from the model's centerline (as defined on pages 37 to 41 to maximum of 18"). Anchor bolt slope shall be no greater than 1:12 (or 5 degrees). Contact the Designer if the holdown anchor is offset more then 1½" or raised more than 6". Raised holdown height is measured from the top of concrete to the top of the holdown bearing plate.
- r. Fasteners are permitted to be installed through metal truss plates when approved by the Truss Designer in accordance with ANSI/TPI 1-2007, Section 8.9.2. Installation of Simpson Strong-Tie® Strong-Drive® screws (SDS) through metal connector plates requires the plates to be pre-drilled using a maximum of a 5/32" bit. Do not drive nails through the truss plate on the opposite side of single-ply trusses which could force the plate off the truss.
- s. For cold-formed steel applications, all screws shall be installed in accordance with the screw manufacturer's recommendations. All screws shall penetrate and protrude through the joined materials a minimum of 3 full exposed threads per AISI Standard for Cold Formed Steel Framing General Provisions, section D1.3, if applicable.
- Nuts shall be installed such that the end of the threaded rod or bolt is at least flush with the top of the nut.
- When installing hurricane ties on the inside of the wall special considerations must be taken to prevent condensation on the inside of the completed structure in cold climates.

GENERAL INSTRUCTIONS FOR THE DESIGNER

These general instructions for the Designer are provided to ensure proper selection and installation of Simpson Strong-Tie Company Inc. products and must be followed carefully. These general instructions are in addition to the specific design and installation instructions and notes provided for each particular product, all of which should be consulted prior to and during the design process.

- a. The term "Designer" used throughout this catalog is intended to mean a licensed/certified building design professional, a licensed professional engineer, or a licensed architect.
- All connected members and related elements shall be designed by the Designer.
- All installations should be designed only in accordance with the allowable load values set forth in this catalog.
- d. Unless otherwise noted, connector allowable loads published in this catalog are limited to the lowest of: average recorded test load at ½" deflection, lowest ultimate recorded test load of 3 tests specimens divided by 3 (or the average of 6 specimens divided by 3), or the calculated value based on steel, wood bearing, and/or fastener capacity.
- e. Allowable simultaneous loads in more than one direction on a single connector must be evaluated as follows:
 - Design Uplift/Allowable Uplift + Design Lateral Parallel to Plate/Allowable Lateral Parallel to Plate + Design Lateral Perpendicular to Plate/Allowable Lateral Perpendicular to Plate < 1.0. The three terms in the unity equation are due to the three possible directions that exist to generate force on a connector. The number of terms that must be considered for simultaneous loading is at the sole discretion of the Designer and is dependent on their method of calculating wind forces and the utilization of the connector within the structural system.
- f. Loads are based on the 2005 National Design Specifications (NDS) and the 2001 AISI Standard North American Specification for the Design of Cold-Formed Steel Structural Members (NASPEC) if applicable, unless otherwise specified. Other code agencies may use different allowable loads.
- g. Duration of load adjustments as specified by the code are as follows: "FLOOR" and "DOWN" (100)—no increase for duration of load. "SNOW" (115)—115% of design load for 2 month duration of load. "ROOF LOAD" (125)—125% of design load for 7 day duration of load.

- "EARTHQUAKE/WIND" (160)—160% of design load for earthquake/wind loading.
- Unless otherwise noted, wood shear is not considered in the loads given; reduce allowable loads when wood shear is limiting.
- i. Simpson Strong-Tie strongly recommends the following addition to construction drawings and specifications: "Simpson Strong-Tie® connectors are specifically required to meet the structural calculations of plan. Before substituting another brand, confirm load capacity based on reliable published testing data or calculations. The Engineer/Designer of Record should evaluate and give written approval for substitution prior to installation."
- Verify that the dimensions of the supporting member are sufficient to receive the specified fasteners, and develop the top flange bearing length.
- k. Some catalog illustrations show connections that could cause cross-grain tension or bending of the wood during loading if not sufficiently reinforced. In this case, mechanical reinforcement should be considered.
- I. For holdowns, anchor bolt nuts should be finger-tight plus ½ to ½ turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken to not over-torque the nut. Impact wrenches should not be used as they may preload the holdown.
- m. Simpson Strong-Tie will provide upon request code testing data on all products that have been code tested.
- n. The allowable loads published in this catalog are for use when utilizing the traditional Allowable Stress Design methodology. A method for using Load and Resistance Factor Design (LRFD) for wood has been published in AF&PA/ASCE 16. A method for using LRFD for cold-formed steel has also been published in the 2001 AISI NASPEC. When designing with LRFD, reference lateral resistances must be used. Contact Simpson Strong-Tie for reference lateral resistances of products listed in this catalog. For more information, refer to the American Forest and Paper Association "Guideline to Pre-engineered Metal Connectors" and ASCE 16. The "Guideline" contains a soft-conversion procedure that can be used to derive reference lateral resistances.

GENERAL INSTRUCTIONS FOR THE DESIGNER (cont.)

- o. For joist hangers Simpson Strong-Tie recommends the hanger height shall be at least 60% of joist height for stability.
 p. For cold-formed steel applications, as a minimum all screws must
- p. For cold-formed steel applications, as a minimum all screws must comply with Society of Automotive Engineers (SAE) Standard J78, Steel Self-Drilling/Tapping Screws, and must have a Type II coating in accordance with ASTM B 633, Electrodeposited Coatings of Zinc on Iron and Steel. Screw strength shall be calculated in accordance with 2001 AISI NASPEC Section E4, if applicable, or shall be based on the manufacturer's design capacity determined from testing.
- q. Local and/or regional building codes may require meeting special conditions. Building codes often require special inspection of anchors installed in concrete and masonry. For compliance with these requirements, it is necessary to contact the local and/or regional building authority. Except where mandated by code, Simpson Strong-Tie products do not require special inspection.
- r. Holdown and Tension Tie allowable loads are based on installations with an anchor rod length of 6" from the concrete to top of holdown seat, yet these products may be raised to any height with consideration of the increased deflection due to additional bolt elongation. For cases where the anchor bolt is offset, Simpson Strong-Tie offers recommendations, subject to the approval of the Designer, which permit holdowns to be raised up to 18" maximum with a corresponding horizontal anchor bolt offset of 11/2". See "General Instructions for the Installer" (page 14 note q).
- s. Throughout the catalog there are installation drawings showing the load transfer from one element in the structure to another. Additional connections may be required to safely transfer the loads through the structure. It is the Designer's responsibility to specify and detail all necessary connections to ensure that a continuous load path is provided as required by the building code.

LIMITED WARRANTY

Simpson Strong-Tie Company Inc. warrants catalog products to be free from defects in material or manufacturing. Simpson Strong-Tie Company Inc. products are further warranted for adequacy of design when used in accordance with design limits in this catalog and when properly specified, installed, and maintained. This warranty does not apply to uses not in compliance with specific applications and installations set forth in this catalog, or to non-catalog or modified products, or to deterioration due to environmental conditions.

Simpson Strong-Tie® connectors are designed to enable structures to resist the movement, stress, and loading that results from impact events such as earthquakes and high velocity winds. Other Simpson Strong-Tie products are designed to the load capacities and uses listed in this catalog. Properly-installed Simpson Strong-Tie products will perform in accordance with the specifications set forth in the applicable Simpson Strong-Tie catalog. Additional performance limitations for specific products may be listed on the applicable catalog pages.

Due to the particular characteristics of potential impact events, the specific design and location of the structure, the building materials used, the quality

of construction, and the condition of the soils involved, damage may nonetheless result to a structure and its contents even if the loads resulting from the impact event do not exceed Simpson Strong-Tie catalog specifications and Simpson Strong-Tie connectors are properly installed in accordance with applicable building codes.

All warranty obligations of Simpson Strong-Tie Company Inc. shall be limited, at the discretion of Simpson Strong-Tie Company Inc., to repair or replacement of the defective part. These remedies shall constitute Simpson Strong-Tie Company Inc.'s sole obligation and sole remedy of purchaser under this warranty. In no event will Simpson Strong-Tie Company Inc. be responsible for incidental, consequential, or special loss or damage, however caused.

This warranty is expressly in lieu of all other warranties, expressed or implied, including warranties of merchantability or fitness for a particular purpose, all such other warranties being hereby expressly excluded. This warranty may change periodically – consult our website www.strongtie.com for current information.

TERMS & CONDITIONS OF SALE

PRODUCT USE

Products in this catalog are designed and manufactured for the specific purposes shown, and should not be used with other connectors not approved by a qualified Designer. Modifications to products or changes in installations should only be made by a qualified Designer. The performance of such modified products or altered installations is the sole responsibility of the Designer.

INDEMNITY

Customers or Designers modifying products or installations, or designing non-catalog products for fabrication by Simpson Strong-Tie Company Inc. shall, regardless of specific instructions to the user, indemnify, defend, and hold harmless Simpson Strong-Tie Company Inc. for any and all claimed loss or damage occasioned in whole or in part by non-catalog or modified products.

NON-CATALOG AND MODIFIED PRODUCTS

Consult Simpson Strong-Tie Company Inc. for applications for which there is no catalog product, or for connectors for use in hostile environments, with excessive wood shrinkage, or with abnormal loading or erection requirements.

Non-catalog products must be designed by the customer and will be fabricated by Simpson Strong-Tie in accordance with customer specifications.

Simpson Strong-Tie cannot and does not make any representations regarding the suitability of use or load-carrying capacities of non-catalog products. Simpson Strong-Tie provides no warranty, express or implied, on non-catalog products. F.O.B. Shipping Point unless otherwise specified.

CONVERSION CHARTS

Steel thickness varies according to mill standards.

Nail Types and Sizes Specified for Simpson Strong-Tie® connectors

Many Simpson Strong-Tie connectors have been designed and tested for use with specific types and sizes of nails. The specified quantity, type and size of nail must be installed in the correct holes on the connector to achieve published loads. Other factors such as nail material and finish are also important. Incorrect fastener selection or installation can compromise connector performance and could lead to failure.

Simpson Strong-Tie does not offer all of these nails, see page 17 for more information.

NAIL DESIGN INFORMATION

In some cases it is desirable to install Simpson Strong-Tie face mount joist hangers and straight straps with nails that are a different type or size than what is called out in the load table. In these cases these reduction factors must be applied to the allowable loads listed for the connector.

Load Adjustment Factors for Optional Nails Used with Face Mount Hangers and Straight Straps

Catalog Nail	Panlacoment	Allowable Load Adjustment Factor					
Catalog Naii	періасепіені	Face Mount Hangers Straight 48"x1½") 0.64 0.8 (0.148"x3") (0.148"x3¾") 0.84 0.8 .148"x3¾") 0.84 0.8 6) (0.162"x2½") 1.00 1.0 48"x1½") 0.77 1.0 48"x1½") 0.64 1.0					
16d common (0.162"x3½")	10dx1½ (0.148"x1½")	0.64	0.847				
16d common (0.162"x3½")	10d common (0.148"x3") 12d common (0.148"x31/4")	0.84	0.84

10d common (0.148"x3") 12d common (0.148"x31/4")	16d sinker (0.148"x31/4")	1.00	1.00				
8d common (0.131"x2½")	8dx1½ (0.131"x1½")	0.85	1.00				
10d common (0.148"x3")	8d common (0.131"x2½")	0.83	0.83				

- 1. Allowable load adjustment factors shown in the table are based on calculated reduction factors and are applicable for all face mount hangers and straight straps throughout this catalog, except as noted in the footnotes below.
- 2. Some products have been tested specifically with alternate fasteners and have allowable load adjustment factors or reduced capacities published on the specific product page which may differ from the values calculated using this table.
- 3. This table does not apply to hangers modified per the Hanger Options described on pages 181-183, or steel thicker than 10 gauge.

 4. Unless noted otherwise, 10dx1½" or 16dx2½ nails may not be substituted for joist nails in double-shear hangers (i.e. LUS, MUS, HUS, HHUS, HGUS). For applications involving pneumatic nails, refer to specific tool manufacturer technical bulletins. Refer to technical bulletin T-PNEUMATIC (see page 191 for details).
- 5. Do not substitute 10dx11/2" nails for face nails on slope and skew combinations or skewed only LSU and LSSU.
- 6. For straps installed over sheathing use a 21/2" long nail minimum.
- Where noted, use 0.80 for 10 ga, 11 ga, and 12 ga products when using SPF lumber.
- 8. Where noted, use 0.92 for 10 ga, 11 ga, and 12 ga products when using SPF lumber.

Double shear nailing should use full length common nails

Shorter nails may not be used as double shear nails

FASTENING IDENTIFICATION

Round Holes Purpose: to fasten a connector. Fill Requirements: always fill, unless noted otherwise.

Obround Holes Purpose: to make fastening a connector in a tight location easier. Fill Requirements:

always fill.

Hexagonal Holes Purpose: to fasten a connector to concrete or masonry. Fill Requirements:

fastening a connector

to concrete or masonry.

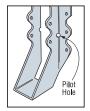

always fill when

Triangular Holes Purpose: to increase a connector's strength or to achieve Max strength. Fill Requirements: when the Designer specifies Max nailing.

Diamond Holes Purpose: to temporarily fasten a connector to make installing it easier. Fill Requirements: none.

Pilot Holes Tooling holes for manufacturing purposes. No fasteners required.

Speed Prongs Used to temporarily position and secure the connector for easier and faster installation.

Positive Angle Nailing (PAN) Provided when wood splitting may occur, and to speed installation.

Dome Nailing This feature guides the nail into the joist and header at a 45° angle. U.S. Patent 5,603,580

Double Shear Nailing The nail is installed into the joist and header, distributing the load through two points on each joist nail for greater strength.

ITS Strong-Grip' (IUS Similar) The Strong-Grip™ seat allows the I-joist to "snap" in securely without the need for joist nails.

ITT Tab Nailing The nail is hammered in at an angle of approximately 45° to prevent the wood from splitting.

SIMPSON STRONG-TIE® NAILS

Simpson Strong-Tie nails and structural fasteners have been developed as the optimum fasteners for connector products. Special lengths afford economy of purchase and installation, and depth compatibility with framing members.

For pneumatic nail use, see Instructions to the Installer, page 14 and visit www.strongtie.com for technical bulletins.

Retail Packaging

1 lb. Retail Tub

5 lb. Retail Bucket

Simpson Strong-Tie hot-dip galvanized nails are packed in 1 lb. and 5 lb. plastic retail containers for easy handling.

Display Packages

- 1. N16 fasteners may be ordered electro-galvanized; specify EG; for example N16EG. This finish is not acceptable for ZMAX® or HDG applications.
- 2. HDG = hot-dip galvanized: SS = stainless steel: Bright = no finish: GV = green vinvl.
- 3. Metric equivalents are listed (Diameter x Length).
- 4. For pneumatic fastener info, request additional technical information.
- 5. Recommended minimum end distance to prevent splitting with a steel side member is 10 x the nail diameter per 2005 NDS Commentary Table 11.1.5.6.
- 6. Use HDG nails with ZMAX and HDG products.
- 7. 16d sinker with GV finish is not acceptable for ZMAX or HDG applications.
- 8. HDG nails sold by Simpson Strong-Tie meet the specifications of ASTM A153. Stainless-steel nails are type 316 stainless.
- 9. Fasteners per CWT references the quantity of fasteners per 100 lbs.

QUIK DRIVE® FASTENERS AND ATTACHMENTS

systems and specialty fasteners engineered for a wide range of commercial and residential construction applications.

Simpson Strong-Tie® Quik Drive offers labor saving auto-feed

See the Quik Drive Auto-Feed Screw Driving Systems catalog (form C-QD) for more information. (See page 191 for details)

AUTO-FEED SCREW DRIVING SYSTEMS

The systems offer several easy-to-use attachments bringing speed and reliability to applications that require the fastening power of screws. Our attachments provide tough, reliable performance in specific fastening applications.

QUIK DRIVE FASTENERS

Featuring patented collation technology, Quik Drive fasteners are designed to meet or exceed industry standards for strength and longevity while offering easy-to-load, tangle-free strips for efficient performance in auto-feed systems.

For more information visit www.strongtie.com

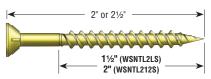

QUIK DRIVE® FASTENERS AND ATTACHMENTS

WSNTL COLLATED SCREW SYSTEM

Simpson Strong-Tie® Quik Drive auto-feed screw driving systems offer superior performance and reduced installation time in subfloor applications. The holding power of screws reduces the gaps that cause floor squeaks and the tool extension enables stand-up-and-drive installation.

Uplift

- 1. Minimum fastener penetration of 11/4" into the framing member is required.
- 2. For IBC wind design, shear capacities may be increased 40% per IBC 2306.3.1. For normal loading, shear capacities shall be reduced 25%. These two adjustments are not included in the Code Report.
- 3. Space screws at 12" on center along intermediate framing members or as required by design to resist wind suction forces on roofs where applicable.
- 4. Framing at adjoining panel edges must be 3 inches nominal or wider, and screws must be staggered where screws are spaced 2" or 21/2" on center.
- 5. When noted in the table, WSNTL212S screws required.
- 6. The values for this application are not included in the Code Report.
- 7. See 2003 IBC chapter 23 for additional requirements and information.
- 8. Allowable withdrawal loads, based on thread penetration into the main member, are 151 lb/in for SP, 125 lb/in for DF, and 88 lb/in for SPF. Values may be increased as permitted by the applicable building code.

TB COLLATED SCREW SYSTEM

Simpson Strong-Tie Quik Drive auto-feed systems with TB series collated screw strips are a fast and reliable way to fasten wood to steel members. They are self-drilling so no predrilling is required.

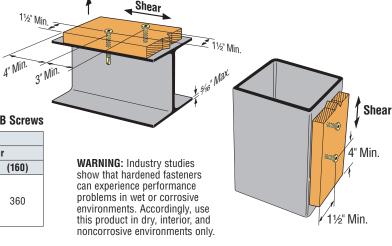

Allowable Loads for Wood Attachment to Steel with Quik Drive TB Screws

TB1475S	3" (75)	2x		400	225	300			

- 1. For use with structural steel members up to 5/16" thick or cold-formed steel members 16 gauge (54 mil) or thicker.
- Standard product available in a black phosphate, yellow zinc dichromate or N2000 finish for additional corrosion protection (TBG1460S or TBG1475S).
- 3. For use with 2x (1½") DF/SP only. 4. For use with QD HSD60 or HSD75 Tool.

Designing with Steel?

If you are designing a structure using Cold-Formed Steel, comprehensive design information on using connectors, Simpson Strong-Tie Anchor Systems® products and Quik Drive® screws in your project can be found in the latest issue of the Simpson Strong-Tie Cold-Formed Steel Connectors catalog (form C-CFS, see page 191 for details). You can access this information via the web at www.strongtie.com.

The Simpson Strong-Tie® Strong-Drive® screw (SDS) is a ¼" diameter structural wood screw ideal for various connector installations as well as wood-to-wood applications. It installs with no predrilling and has been extensively tested in various applications. The new SDS is improved with a patented new easy driving 4CUT™ tip and a corrosion resistant double-barrier coating.

The SD8 #8x1¼" wafer head screw is ideal for miscellaneous fastening applications. The needle point ensures fast starts and deep #2 Phillips drive reduces cam-out and stripping.

SDS FEATURES:

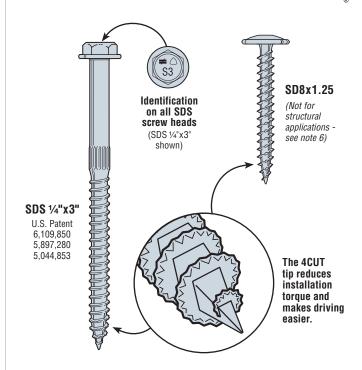

- The patented 4CUT tip has a square core and serrated threads to reduce installation torque and make driving easier with no predrilling and minimal wood splitting.
- A new double-barrier coating finish provides corrosion resistance equivalent to hot-dip galvanization. Now one screw can handle interior, exterior and certain pressure-treated wood applications (see Corrosion Information on page 10-11 for more information).
- %" hex washer head is stamped with the No-Equal sign and fastener length for easy identification after installation.

MATERIAL: Heat-treated carbon steel

FINISH: SDS—New double-barrier coating. SDS screws may also be available yellow zinc dichromate or HDG (*Not all sizes are available in all coatings – Contact Simpson Strong-Tie for product availability and ordering information*); SD8x1.25—Electro Galvanized.

CODES: See page 12 for Code Reference Key Chart.

WARNING: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, the SD8 should be used in dry, interior, and noncorrosive environments only.

These products feature additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Allowable loads for SDS screws are based on ICC-ES Code Report ESR-2236.
 Screws may be provided with the 4CUT or Type 17 tip.
- 2. SDS screws install best with a low speed ½" drill with a %" hex head driver.
- 3. Wood to wood applications are based on a wood thickness of 1½" side member. All applications are based on full penetration into the main member. Refer to technical bulletin T-SDSCREWAPPS for allowable loads for other side member thicknesses.
- 4. Allowable loads are shown at the wood load duration factor of C_D =1.00. Loads may be increased for load duration by the building code up to a C_D =1.60.
- Withdrawal loads shown are in pounds (lbs.) and are based on the entire threaded section installed into the main member. If thread penetration into the main member
- is less than the Thread Length as shown in the table, reduce allowable load by 172 lbs. x inches of thread not in main member. Use 121 lbs./inch for SPF.
- 6. DO NOT USE SD8x1.25 wood screws with structural connectors unless specifically stated in this catalog.
- 7. SD8 requires ¾" minimum penetration.
- Fasteners per Carton represent the quantity of screws which are available in bulk packaging. Screws are also available in mini bulk and retail packs.
 Refer to Simpson Strong-Tie List Price book. Contact Simpson Strong-Tie for more information.
- 9. LSL wood-to-wood applications that require 4½" and 6" SDS screws are limited to interior-dry use only.

UFP Universal Foundation Plate

SIMPSON
Strong-Tie

The UFP provides a retrofit method to anchor the mudsill to the side of the foundation in applications where minimum vertical clearance exists. The UFP is also designed to perform when the mudsill is offset from the foundation up to $2\frac{1}{2}$ " or extended beyond the foundation up to $\frac{1}{2}$ ".

The UFP may be used in place of the FA, HFA and FAP connectors.

MATERIAL: 14 gauge

FINISH: Galvanized. May be ordered HDG, contact Simpson Strong-Tie. See Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners; see General Notes.

- Loads are based on test results using Simpson Strong-Tie[®] SDS ½"x3" screws, which are supplied with the UFP10.
- Alternate lag screws will not achieve published loads.
- Refer to technical bulletin T-ANCHORSPEC or flier F-PLANS for post-installed anchorage solutions (see page 191 for details).

CODES: See page 12 for Code Reference Key Chart.

10" 63/4" Max	UFP10 installed on a Straight Foundation
UFP10 installed	

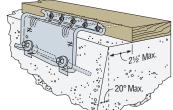

U.S. Patent 5,732,519

UFP10 installed on a Straight Foundation with ½" Offset Mudsill

Model No.	replace Anchor Bolt	Ancho	or Bolt Plate		DF/SP Parallel to Plate	Code Ref.	
	½" or %" dia.	Qty.	Dia.	riale	(160)		
UFP10-SDS3	6'	2	1/2	5-SDS 1/4"x3"	1340	I20, L26, F19	

 Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other load durations apply.

2. Each anchor bolt requires a standard cut washer.

UFP10 installed on a Trapezoid Foundation

FAP/FJA/FSA Foundation Anchors

The FAP Plate connects the mudsill to the foundation, and is designed to provide lateral load resistance.

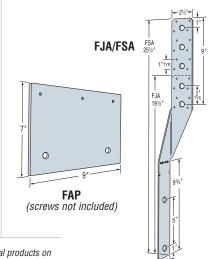

The FJA Foundation Joist Anchor nails or bolts directly into floor joists, providing a direct connection between the foundation and joist to resist uplift and lateral forces. FSA Foundation Stud Anchor nails or bolts to floor joists, or nails to the stud. Plywood sheathing may require notching with stud-to-foundation installation.

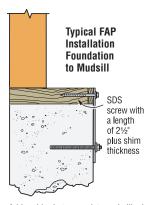

MATERIAL: FAP—7 gauge; all others—12 gauge FINISH: Galvanized. May be ordered HDG, contact Simpson Strong-Tie. See Corrosion Information, page 10-11.

INSTALLATION:

- Use all specified fasteners; see General Notes.
- Refer to technical bulletin T-ANCHORSPEC for postinstalled anchorage solutions (see page 191 for details).

CODES: See page 12 for Code Reference Key Chart.

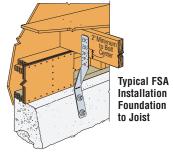

Add a shim between plate and sill when space is between \$4e" and \$1½". When space exceeds \$1½" use the UFP. The shim must be fastened to the mudsill by means other than the FAP SDS wood screw.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

	Max S	pacing		F	asteners	Allowa	DF/SP

- 1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other load durations govern.
- 2. For redwood mudsills, reduce F₁ on FAP to 840 lbs.
- 3. Spacing to be specified by the Designer.
- FAP shall use a minimum SDS wood screw length of 2½" plus the shim thickness.
- The shim must be fastened to the mudsill by means other than the FAP SDS wood screw.
- FAP may be installed with 1/4" HDG lag bolts. Follow code requirements for predrilling.
- NAILS: 10dx1½ = 0.148" dia. x 1½" long.
 See page 16-17 for other nail sizes and information.

Typical FSA Installation Foundation to Stud

Typical FJA Installation Foundation to Joist

MAS/MASA/MASAP/MASB/MASP Mudsill Anchors WEINEERED.

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

MAS style mudsill anchors are easy to install for both the concrete and framing contractor. They are suitable for either stemwall or slab foundations and easily mount on the forms before the pour, simplifying finishing and reducing anchor mislocation problems. The MAS eliminates the need to drill the mudsill and can be installed three different ways to provide flexibility when stud placement or sheathing becomes an issue (see table below).

The new and improved MASA/P provides the installation advantages of mudsill anchors combined with the maximum allowable on-center spacing. The new stronger design provides parallel-to-wall load carrying capacity that meets or exceeds most cast-in-place anchors. This allows for a one-to-one replacement of 1/2" bolts on 2x or 3x sills and 5/8" bolts on a 2x sill.

The different models of mudsill anchors are designed for specific applications:

MAS/MASA—installed at the top of the form MASP/MASAP—for panelized forms

MASB—used in concrete masonry units.

MATERIAL: 16 gauge

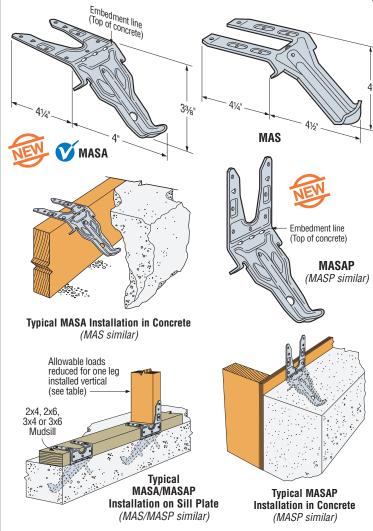

FINISH: Galvanized, all available in ZMAX® coating. See Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

MAS/MASP/MASA/MASAP

- Concrete shall have a minimum f'c = 2500 psi.
- Spalling—Full published capacity is achieved so long as a maximum height of 11/4" and a maximum depth of 7/8" is not exceeded. Any exposed portion of the mudsill anchor must be protected against possible corrosion.
- For prescriptive anchor spacing refer to page 23.
- Testing shows that these mudsill anchors can be used in lieu of code required anchor bolts and square washer in high seismic zones. Refer to technical bulletin T-MASSW for additional information (see page 191 for details).
- MASB—Fill CMU cell with concrete grout first, then place MASB into the grouted cell and adjust into position. Attach mudsill to anchor only after the concrete grout cures.
 - CMU shall have a minimum f'm = 1500 psi.
 - The MASB Mudsill Anchors were tested in standard 8" CMU.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Factories Attached to DE/SP Sill Plate Attached to HE Sill Plate

- 1. Loads have been increased for short-term loading.
- 2. For uplift loads, provide attachment from mudsill to building's structural components to prevent cross-grain bending.
- 3. For stemwall applications, allowable loads are based on a minimum stemwall width of 6".
- 4. For simultaneous loads in more than one direction, the connector must be evaluated using the Unity Equation. See page 14 under General Instructions for the Designer.
- 5. Stud-to-plate connectors must be installed on the same side of the plate as the MAS/MASP or MASA/MASAP straps to complete the continuous load path.
- 6. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.
- 7. **NAILS:** $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

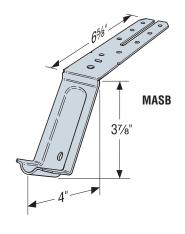

MAS/MASA/MASAP/MASB/MASP Mudsill Anchors

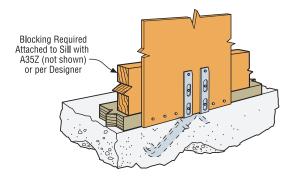

Prescriptive Anchor Spacing

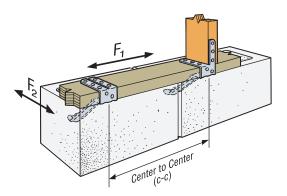

Model No.	O.C. Spacing to replace ½" Anchor Bolt 6' O.C. (160)	O.C. Spacing to replace 5½" Anchor Bolt 6' O.C. (160)	Min. Concrete End Distance	Min. C-C Spacing
MAS or MASP	5'-0"	4'-0"	4"	8"
MASA or MASAP ⁶	6'-0"	6'-0"	4"	8"
MASB	5'-6"	4'-8"	3¾"	7½"

- 1. Place anchors not more than 12" from the end of each sill per code.
- 2. Spacing is based on parallel to plate load direction only.
- 3. CMU shall have a minimum f'_m = 1500 psi and concrete shall have a minimum f'_c = 2500 psi. 4. Spacing applies to DF, SP, and HF 2x sill plates.
- 5. For installations to rim joist or blocking, MASB spacing is 1'-10" for replacing 1/2" bolts and 1'-6" for 5/8" bolts. MAS/P and MASA/P remain the same as the table.
- 6. When replacing ½" sill bolts use 7-10dx1½" nails (minimum nailing) and when replacing %" sill bolts use 9-10dx1½" nails (maximum nailing).

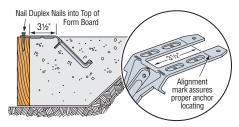

MAS/MASP Rim Joist or Blocking Installation in Concrete over Max. 1/2" Sheathing (MASA/MASAP/MASB similar)

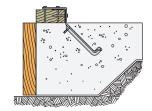

Typical MASB Installation

ALTERNATIVE MUDSILL ANCHOR INSTALLATIONS

ALTERNATE INSTALLATION FOR INSIDE OF WALL CONTINUITY

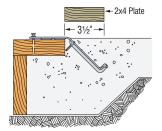

Attach MAS/MASA 31/2" from inside of form. After concrete cures, remove nails and bend straps up 90°

STEP 2:

Place mudsill on concrete and nail MAS/MASA over mudsill

ALTERNATE INSTALLATION FOR BRICK LEDGES

Alternate MAS Installation for Brick Ledges (MASA similar)

131/8" MAB15

211/4"

MAB23

MAB

LMAZ/MA/MAB Mudsill Anchors

Mudsill anchor provide an alternative to anchor bolts. They easily mount on forms and make finishing easier. The unique design provides installation flexibility, eliminating problems with misplaced anchor bolts. Suitable for stem wall or slab foundations, mudsill anchors are one piece so there are no more nuts and washers to lose.

LMAZ—an economical replacement for ½" sill plate anchor bolts

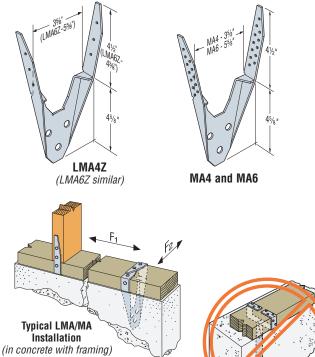

MA-for slab or stem wall construction MAB—anchors mudsill to concrete block, poured walls or slab foundations

MATERIAL: LMAZ, MAB-18 gauge; MA-16 gauge FINISH: MA, MAB—Galvanized (some available in ZMAX® coating); LMAZ—ZMAX only. See Corrosion Information, page 10-11.

INSTALLATION:

- Use all specified fasteners. See General Notes.
- CMU shall have a minimum f'm = 1500 psi and concrete shall have a minimum f'c = 2000 psi.
- · Not for use where a horizontal cold joint exists between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load.
- Not for use in slabs poured over foundation walls formed of concrete block or with brick and 4" masonry block stemwalls.

CODES: See page 12 for Code Reference Key Chart.

MAB Misinstallation (MAB straps must be separated before the concrete is poured)

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

MAB23	2'-9"	1'-11"	12"	24"	

- Place anchors not more than 12" from the end of each sill per code.
- Spacing is based on parallel to plate load direction only.
- CMU shall have a minimum $f'_{m} = 1500$ psi and concrete shall have a minimum $f'_{c} = 2000$ psi
- 4. Spacing applies to DF, SP, and HF 2x sill plates.

Typical MAB15 Installation in Concrete (MAB23 similar, with 15 minimum embedment) Not applicable for concrete block installation

Typical MAB23 Installation in **Concrete Block** (MAB15 similar) MAB23 provides a two block embedment, if required by the local code jurisdiction

FWAZ/FWANZ Foundation Wall Angle

SIMPSON
Strong-Tie

Concrete Connectors & Anchors

FWA foundation anchors connect the foundation or basement walls to the floor system to resist out-of-plane forces imposed by soil pressure. The FWAZ attaches through the mudsill into the foundation using the Simpson Strong-Tie® Titen HD® heavy-duty screw anchor, eliminating the need for separate anchor bolts into the rim joist. The NEW FWANZ fastens to the mudsill with nails, relying on other anchorage (by Designer) to anchor the rim joist to the foundation. The spacing of the FWA anchors is independent of the joist spacing, allowing for a multitude of options based on soil pressures.

Special Features:

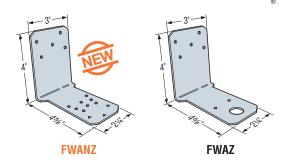

- Compatible with solid sawn joists, I-joists and floor trusses.
- Testing performed on most common rim materials and types.
- Addresses design needs set forth in Section 1610.1 in the IBC and Section R404 in the IRC.
- · Eliminates the need of costly cantilevered foundation designs.

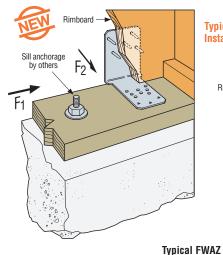

MATERIAL: 14 gauge

FINISH: ZMAX® coating. See Corrosion Information, page 10-11. **INSTALLATION:** • Use all specified fasteners. See General Notes.

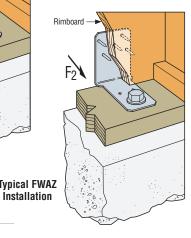

- Connectors must be fastened directly to the outside face of the rim board with 5-10dx1½ (0.148" dia. x 1½") long nails.
- Connectors must be located within 5" of adjacent joist/blocking for floor joist spacings larger than 16" o.c. and may be centered between joists/blocking for 16" o.c. floor joist spacing.
- When floor joists are parallel to the rim board, full depth blocking shall be used in the first two bays of the floor per 2006 IRC Section R404.1.
- Splice joint not permitted on rim board in same bay unless blocking is placed on both sides of the splice. The maximum sill plate thickness to be used for the FWAZ only shall be 1½".
- FWAZ only—must be anchored to the foundation wall with %"x6" mechanically galvanized Titen HD anchor (included). Cast-in-place anchor bolts may not be used as a substitute.
- Splice joint not permitted on rim board in same bay as FWANZ unless blocking is placed on both sides of the splice joist.
- When I-joist rim material is used, backer blocks must be used. Installed per manufacturer's recommendations.

CODES: See page 12 for Code Reference Key Chart. Refer to IBC 1610.1.

Typical FWANZ Installation

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Lateral (F₂) loads are based on load duration factor C_D = 0.90 with no further increase allowed.
- Trivial Spacing shall be per Designer. Refer to flier F-FWAZ (see page 191 for details) for prescriptive spacing options and additional information.
- FWAZ must be located within 5" of adjacent joist/blocking for floor joist spacings larger than 16" o.c. and may be centered between joists/blocking for 16" o.c. floor joist spacing.
 Maximum sill plate thickness shall be 1½".
- 5. The Titen HD anchor used in the FWAZ to resist the out-of-plane (F2) forces may also be used to resist in-plane shear forces provided the Designer determines the Titen HD anchor allowable loads (refer to C-SAS catalog, see page 191 for details) and evaluates the combined loading condition with the published Fa loads
- with the published F_2 loads. 6. **NAILS**: $10dX1\frac{1}{2} = 0.148$ " dia. $\times 1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

1.	FWANZ may be used to transfer F ₁ loads
	up to 310 lbs. No further increase in load
	permitted.

- 2. For simultaneous F₁ and F₂ loads, the connector must be evaluated using the unity equation (see page 14)
- unity equation (see page 14).

 3. Designer shall evaluate rim board and sill plate design based on demand load.
- FWANZ spacing and sill plate anchorage to be specified by the Designer.
- 5. For joist/blocking spacing greater than 16" o.c. the FWANZ must be located within 5" o.c. of the adjacent joist/blocking.
- When floor joists are parallel to the rimboard, Designer must ensure proper load transfer from rimboard into diaphragm.
- Values based on a load duration factor C_D = 0.90.
- 8. NAILS: 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

ANCHORMATE® Anchor Bolt Holders

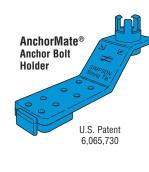

SIMPSON
Strong-Tie

Designed to hold the anchor in place before the concrete pour, as required in some jurisdictions.

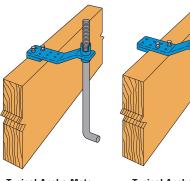

- Built-in 2x4 and 2x6 stops eliminate measuring.
- · Elevated bolt grippers allow easy trowel finishing.
- · Color-coded for easy size identification.
- · Lightweight, durable and easy to use.
- Reusable yet cost-efficient for single application.
- Threaded grippers hold each bolt in the exact same location and height. They secure the bolt in place without a nut for quicker set-up and tear-down, and protect threads from splashing concrete.
- Use the %" and %" AnchorMate to secure the SSTB to the formboard before the concrete pour. Alignment arrows (left or right) match the SSTB bolt head arrow.
- Available in cartons of 100 parts or bags of 10 parts (except AM1 which are only available in cartons of 100 parts).

MATERIAL: Nylon

CODES: See page 12 for Code Reference Key Chart.

Typical AnchorMate Installation for a 2x6 Mudsill

Typical AnchorMate Installation for a 2x4 Mudsill

ABS Anchor Bolt Stabilizer

The ABS stabilizes the anchor bolt to prevent it from being pushed against the form during the concrete pour.

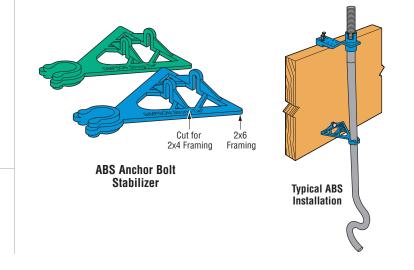

FFATURES

- Supports the bolt approx. 8" below the top of the concrete.
- Model ABS% is for the %" SSTB and ABS% is for the %" SSTB.
- . Thin section limits the effect of a cold joint.
- · Sized for 2x4 and 2x6 mudsills.

MATERIAL: Engineered Composite Plastic.

CODES: See page 12 for Code Reference Key Chart.

Model No.	Diameter	Color	Code Ref.	
ABS%	5/8	Blue	180	
ABS%	7/8	Green	100	

STRAPMATE® Strap Holder

The StrapMate is designed to keep the STHD, LSTHD, HPAHD and PAHD straps vertically aligned during the concrete pour to minimize possibility of spalling. The friction fit allows for quick and easy installation.

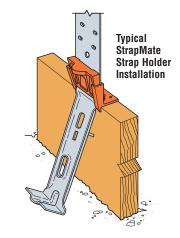

- The StrapMate is reusable.
- Works with STHD, LSTHD, HPAHD, PAHD.

MATERIAL: Engineered Composite Plastic.

- Designed to fit ¾" plywood forms up to 1¾" LVL forms and larger.
- The strap is positioned off the front edge of the form board.

Model No.	Nails	Code Ref.		
SM1	2-8d Duplex	180		

SB Anchor Bolt

SIMPSON

The geometry of the SB bolt is the latest development in high capacity anchors. The smooth transition angle of the bolt positions the head of the anchor into an optimum position in the concrete stem wall without creating excessive horizontal forces. The SB7/ax24 is designed to maximize performance with minimum embedment while the SB1x30 is intended to cover holdown devices that exceed the capacity of SSTB anchors.

Special Features:

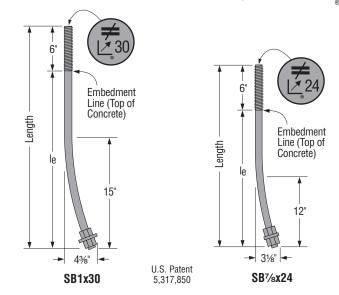

- · Identification on the bolt head showing embedment angle and model
- · Stamped embedment line
- Rolled thread for higher tensile capacity
- Tested in different compressive strength concretes for versatility in specification

MATERIAL: ASTM A36

FINISH: None. May be ordered HDG. Contact Simpson Strong-Tie. INSTALLATION:

- · SB is only for concrete applications poured monolithically.
- Install 1-#4 rebar in the area 3" to 5" (may be foundation rebar not post-tension cable) from the top of the foundation.
- Top nuts and washers for holdown attachment are not supplied with the SB; install standard nuts, couplers and/or washers as required.

CODES: See page 12 for Code Reference Key Chart.

- . Loads may not be increased for short-term loading. Loads apply to earthquake and wind loading.
- Minimum anchor center-to-center spacing is 3 le for anchors acting in tension at the same time for full load.
 Allowable loads are based on ultimate test load divided by a factor of 3.0.
 Contact Simpson Strong-Tie for testing and design information.

 For two pour installations (see drawing below) with a SB1x30, use the table loads for the SB76x24.

- 5. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.

HHDQ11

HHDQ14⁴

No cold joint within the embedment depth.
The Design Engineer may specify an alternate
anchorage system provided the diameter is the same.

Where noted, the allowable load for this application is 13675 lbs. which is less than the published loads for these holdowns. For concrete strengths 3000 psi or greater, the maximum allowable load for the holdown can be achieved

5. Where noted SB7/sx24 may be used on 3" (post) wood member thickness when using f'c = 3000 psi for the foundation concrete.

6. Where noted SB1x30 may be used for 5½" (post) wood member thickness when 3000 psi foundation concrete is used. 3½" and 4½" (post) wood member thicknesses may be used when using 2500 psi foundation concrete. See catalog page 41 for (post) wood member thickness info

7. When SB is used with the HD holdown and a sill plate greater in thickness than 11/2", then provisions

The SSTB is designed for maximum performance as an anchor bolt for holdowns and Strong-Wall® shearwalls. Extensive SSTB testing has been done to determine the design load capacity at a common application, the garage stem wall. Design loads are based on a series of five tests, with a three-times reduction factor. SSTB14 is a 5/8" diameter anchor bolt designed and tested specifically for shallow foundation installations.

SPECIAL FEATURES: • Rolled threads for higher tensile capacity.

- Offset angle reduces side-bursting, provides more concrete cover.
- · Stamped embedment line aids installation.
- · Configuration results in minimum rebar interference.

MATERIAL: ASTM A36

FINISH: None. May be ordered HDG: contact Simpson Strong-Tie.

INSTALLATION: • SSTB is used for monolithic and two-pour installations.

• Nuts and washers are not supplied with the SSTB; install standard nuts, couplers and/or washers as required. On HDG SSTB anchors, chase the threads to use standard nuts or couplers or use overtapped products in accordance with ASTM A563 (Simpson NUT%-OST, NUT%-OST, CNW%-%OST, CNW%-%OST)

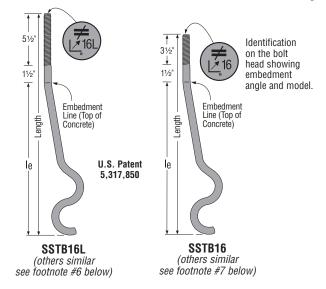

REINFORCED CONCRETE FOUNDATION

- Install SSTB before the concrete pour using AnchorMates® (see page 26). Install the SSTB per plan view detail shown on page 29. Install one #4 rebar 3" to 5" (may be foundation rebar not post-tension cable) from the top of the foundation.
- The SSTB does not need to be tied to the rebar.
- Minimum concrete compression strength is 2500 psi. Unless noted otherwise, no special inspection is required for foundation concrete when the structural design is based on concrete no greater than 2500 psi (IBC Section 1704.4).
- Unless otherwise noted, do NOT install where: (a) a horizontal cold joint exists within the embedment depth between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load, or the slab is designed to resist the load imposed by the anchor; or (b) slabs are poured over concrete block foundation walls.

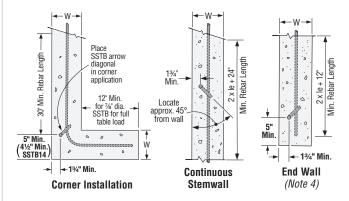

REINFORCED CONCRETE BLOCK

- Before concrete pour, install diagonally at approx. 45° in the cell per plan view detail shown on page 27.
- Horizontal #4 rebar (minimum 56" long centered about the anchor bolt)—approximately one rebar 12" from the top and two rebars approximately 28" from the top. Vertical #4 rebar (minimum 24" long) install with maximum 24" o.c. spacing.
- Grout all cells with minimum 2000 psi concrete. Vibrate the grout per the IBC, Section 2104.1.

CODES: See page 12 for Code Reference Key Chart.

See page 27 for additional installation details.

TYPICAL PLAN VIEWS OF REBAR INSTALLATION

SELECTION GUIDE (Per Anchor Bolt Diameter)

Model No.	2x, 3x1, 2-2x	¹ Sill Plates
Model No.	Mono Pour	Two Pour

HDU8, HDQ8,HDC10/22 ⁴ , HDC10/4 ⁴ , HD7, HD9 ⁹	SSTB28	SSTB34

- 1. SSTBL models are recommended for HDU, HDQ8, and HD holdowns on 2-2x and 3x sill plates. Where SSTB14's are specified for these products, use SSTB16L.

 2. No cold joint within embedment depth unless provisions
- are made to transfer the load.
- The design engineer may specify an alternate anchorage system, provided the anchor diameter is the same.
- system, provided the anchor diameter is the same.

 Increase the embedment depth 2½" to accommodate the HDC standoff block.

 Where noted the allowable load for this application is limited to 4600 lbs. which is less than the published
- loads for these holdowns.

 6. Where noted the allowable load for single pour is limited to 5175 lbs. which is less than the published loads for these holdowns
- 7. SSTB14 can be used for this application with a 9" stemwall width.
- here noted SSTB20 may be used on 1½", 2" and 3" (post) wood member thicknesses. See catalog page 41 for (post) wood member thickness info.
- Where noted SSTB28 may be used on 3" (post) wood member thickness.

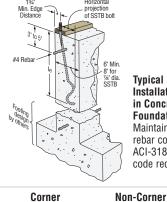

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

	Stem-			Min.	Allowa	ble Tension	Load ^{1,2}

SSTB28	8	7/8	29% (SSTB28L = 32%)	247/8	10100	6385	4815	L6, F24
SSTB34	8	7/8	34%	28%	10100	6385	4815	
SSTB36	8	7/8	36%	28%	10100	6385	4815	

- Loads may not be increased for short-term loading. Loads apply to earthquake and wind loading.
- Minimum anchor center-to-center spacing is 2le for anchors acting in tension at the same time for full load.
- The SSTB was tested in a stem wall with a minimum amount of concrete cover.
- Use full table load when installed 24" from the end or installed in a corner condition (see illustrations). When used 5" from the end of a concrete foundation (see end wall graphic above), the maximum allowable load is 9045 lbs. for SSTB28, 9585 lbs. for SSTB34 and 36 bolts, and table loads for all other models (these loads are not Code listed – contact Simpson Strong-Tie for test data)
- HDU and HTT minimum end distance is 43%".
- Order the SSTBL models (ex. SSTB24L) for longer thread length ($16L = 5\frac{1}{2}$ ", $20L = 6\frac{1}{2}$ ", 24L = 6", $28L = 6\frac{1}{2}$ "). SSTBL and SSTB loads are the same. Not available on SSTB14.
 SSTB34 has 4½" of thread and SSTB36 has 6½". These two models are not available in SSTBL versions.
- Use 90% of the table load for 2000 psi concrete.
- Allowable load for SSTB14 is 5020 lbs. when $f'_{C} = 3000 \text{ psi}$.
- 10. Minimum end distance required to achieve table loads is le.
- 11. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.

	1 74	Seismic	14	21	22580	13	191/2	22580

- 1. Anchor embedment length is based on a single pour concrete foundation within the footing dimensions de and F.
- Double pour foundation systems, masonry walls and masonry footings must be evaluated by the Designer.

 Anchor bolt must be ASTM A307 or A36 steel.

 Anchor head requires two hex nuts with a 2½"x2½"x%" plate. Use of a Simpson Strong-Tie® Bearing Plate BP1 (see catalog page 31) may be used as a substitute for 1" diameter bolts and Simpson Strong-Tie Bearing Plate BP¾ may be used as a substitute plate for ¾" diameter bolts.
- 4. Published loads are for use with Allowable Stress Design. IBC Seismic values denote SDC C through F. IBC Wind values include SDC A and B.
- Design values are based on ACI 318-05 App. D where cracked concrete is assumed and additionally for seismic loads ductility requirements per D.3.3.4 are considered.

Anchor with Nut/Washer/Nut

Design loads are calculated using a full shear cone. Coverage on each side of the bolt shall be a minimum of F or reductions must be taken.

WT Wedge Form Ties

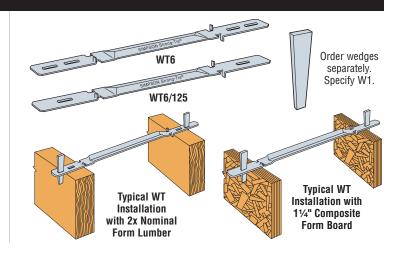

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

Designed for low foundation wall applications. 5/8" wide formed "V" design for rigidity allows accurate form spacing and support. Sizes now available for composite form board.

MATERIAL: Wedges—14 gauge, WT—18 gauge FINISH: Galvanized INSTALLATION: • Use two 3½" long wedges for each tie.

- · Not recommended for wall pours greater than 4' high.
- Wall thickness from 6" to 12".
- · Refer to technical bulletin T-WT for recommended spacing (see page 191 for details).

Model No.	Form Board	Wall Thickness
WT6		6

WT12/125		12

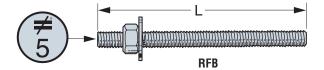

RFBs are clean, oil free, pre-cut threaded rod, supplied with nut and washer. Offers a complete engineered anchoring system when used with Simpson Strong-Tie® adhesive. Inspection is easy; the head is stamped with rod length and "No Equal" symbol for identification after installation.

MATERIAL: A307 Grade C

FINISH: Zinc Plated (unless otherwise noted), available in HDG (per ASTM A153); stainless steel (RFB#5x8SS only).

See page 33-36 for application information and request technical bulletin T-ANCHORSPEC for additional product use information (see page 191 for details).

These products feature additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No.	Length L (in)	Bolt Diameter

RFB#5X12HDG-R	12	5/8
RFB#5X16	16	5/8
RFB#6X10.5	10½	3/4

- 1. RFB#4X8HDG-R and RFB#5X12HDG-R are only available with a hot-dip galvanized coating. They are retail packaged and are sold 10 per carton.

 2. Washer provided on all RFB (except RFB#5x8SS).

CNW/HSCNW Coupler Nuts

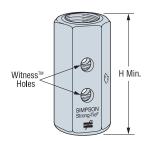

Simpson Strong-Tie® coupler nuts are a tested and load rated method to join threaded rod and anchor bolts. "Witness" holes in the nut provide a means to verify when rods are properly installed. The positive stop feature helps ensure even threading into each end of the nut. CNW's meet and exceed the capacity of corresponding ASTM A36 bolts and threaded rod. HSCNW's meet and exceed the capacity of corresponding ASTM A449 bolts and threaded rod. Contact Simpson Strong-Tie for other coupler nut sizes.

FINISH: Zinc Plated INSTALLATION:

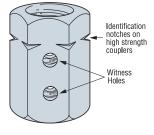

- Tighten the two rods until each all-thread rod is visible in the witness hole.
- For non-hot-dip galvanized all-thread rod only.
- \bullet %" and %" diameter couplers available with oversized threads for installation to hot-dip galvanized bolts (order CNW%-%OST and CNW%-%OST).

Model No.	Rod Diameter	H Min	Allowable Tension Capacity (lbs.)	Code Ref.

BP/LBP Bearing Plates

SIMPSON
Strong-Tie

Bearing Plates give greater bearing surface than standard cut washers, and help distribute the load at these critical connections.

The BP½-3 and BP%-3 are 3"x3" bearing plates that meet the latest requirements of the IRC and IBC. These plate washers are available uncoated or with a hot-dip galvanized (HDG) coating.

The BPS and LBPS are 3"x3" bearing plates that offer increased flexibility while meeting the latest requirements of the code. The slotted hole allows for adjustability to account for bolts that are not in the middle of the sill plate.

The BP%SKT uses SDS ¼"x1½" screws to provide lateral resistance when 5%" diameter sill holes are overdrilled (screws are provided). The shear capacity of the connection and the sill/anchor bolt shall be determined by the Designer for each installation.

MATERIAL: See table

FINISH: LBP, LBPS & BP5/6S—Galvanized; BP7/6-2—Zinc Plated; BPS, BP—Mone. BP's and BPS's may be ordered HDG; LBP and LBPS products may be ordered ZMAX®; contact Simpson Strong-Tie. Refer to page 10-11 for Corrosion Information.

INSTALLATION: See General Notes.

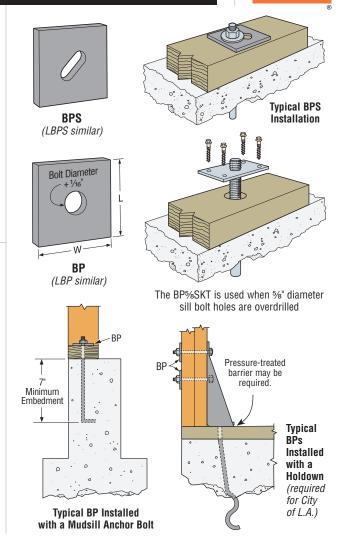

CODES: See page 12 for Code Reference Key Chart.

2006 IRC R602.11.1, 2006 IBC 2305.3.11 (see footnote 2 below)

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

GH Girder Hangers

A girder-to-foundation wall connection.

MATERIAL: 12 gauge

FINISH: Painted. May be ordered HDG, contact Simpson Strong-Tie.

See Corrosion Information, page 10-11.

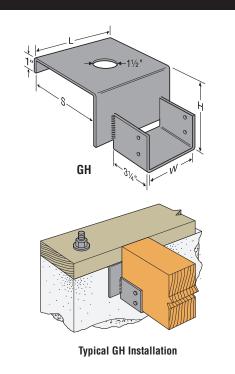

INSTALLATION: • Use all specified fasteners. See General Notes.

- Insert four 16d commons into girder.
- H = girder height mudsill thickness.
- 1½" clearance hole accommodates rebar or anchor. This is not required.

OPTIONS: For skewed and saddle hangers, see Hanger Options on pages 181-183. Contact Simpson Strong-Tie for other sizes available.

- 1. Loads may not be increased for short-term loading.
- 2. A mudsill on top of the GH is required to achieve the table loads
- 3. Models listed are for a 2x plate, specify "H" dimension when ordering for use with a 3x plate.
- 4. Uplift loads do not apply for this hanger.
- 5. NAILS: 16d = 0.162" dia. x $3\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

The GLB Series provides a connection between beam and concrete or CMU pilaster.

FINISH: Simpson Strong-Tie® gray paint

INSTALLATION:

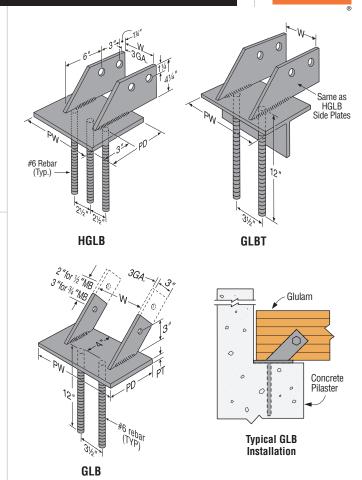

- · Use all specified fasteners. See General Notes.
- Bolt holes shall be a minimum of 1/22" to a maximum of 1/16" larger than the bolt diameter (per the 2005 NDS, section 11.1.2).
- Check the rebar spacing requirements on all installations.

OPTIONS:

- Sawn timber and other sizes may be ordered by specifying special dimensions; use the letter designations shown on the illustrations.
- Specify if two-bolt GLB model is desired; see illustration.

- Allowable bearing stress for masonry is based on an f'm of 1500 psi using the IBC (ACI 530 2.1.9.3) Allowable Stress Design. Wood bearing is based on f'c-perp of 560 psi.
- 2. When installed on masonry, use the lesser of the masonry or the wood allowable load values.

 When installed on concrete, a minimum f'_C = 2000 psi shall be used and use the wood values as the limiting allowable bearing load values.
- Allowable horizontal loads are bolt values and include a 60% increase for wind or earthquake loading. Loads must be reduced if stresses in masonry or concrete are limiting.
- 4. Beams must fully bear on base plate.
- 5. The GLBT5 has a WT4x9 structural tee; the GLBT6 has a WT4x12 structural tee.
- 6. Specify "W" dimension when ordering.
- 7. Uplift loads do not apply for this connector.

ANCHORING SYSTEMS SIII Plate Anchor Solutions

Simpson Strong-Tie Anchor Systems® offers several post-installed solutions for sill plate anchorage to concrete or concrete block foundations. Often times these products are used in retrofit applications or when cast-in-place anchors are omitted or mislocated. Some products are available in galvanized and stainless steel versions to address most preservative-treated wood applications.

For complete information on product performance, installation requirements and appropriate code listings for Simpson Strong-Tie Anchor Systems products please refer to the *Anchoring and Fastening Systems for Concrete and Masonry* catalog (form C-SAS) or visit www.simpsonanchors.com.

For Corrosion Information, refer to Simpson Strong-Tie Anchoring and Fastening Systems for Concrete and Masonry catalog (C-SAS).

EXTERIOR/INTERIOR SILL PLATE ANCHORAGE SOLUTIONS

The Titen HD® anchor and RFB Retrofit Bolt with Simpson Strong-Tie® adhesive may be used for sill plate applications. Use bearing plates as required by Code. Refer to the appropriate Code report or use Simpson Strong-Tie ACI 318 Anchor Designer™ software for anchor design information.

RFB

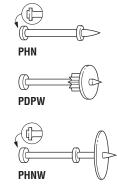

INTERIOR (ONLY) SILL PLATE ANCHORAGE SOLUTIONS

Simpson Strong-Tie Anchor Systems offers a full line of powder actuated tools, fasteners and powder loads for fastening to concrete and steel. Powder actuated pins are often used to fasten the sill plate to concrete slabs.

For complete information on product performance, installation requirements and appropriate code listings for Simpson Strong-Tie Anchor Systems products please refer to the *Anchoring and Fastening Systems for Concrete and Masonry* catalog *(form C-SAS)* or visit **www.simpsonanchors.com**.

PDPWL
(PDPWL available in galvanized coating for preservative-treated wood applications)

These products are available with additional corrosion protection.

Catalog	Overall	Head Diameter	Shank Diameter	Maximum Spacing (in.)

- 1. Spacings are based upon the attachment of 2-inch (nominal thickness) wood sill plates, with specific gravity of 0.50 or greater, to concrete floor slabs or footings. For species of wood with specific gravity of 0.42 to 0.49, multiply required spacing of fasteners for shear walls by 0.81. For species of wood with specific gravity of 0.31 to 0.41, multiply the required spacing of fasteners for shear walls by 0.65.
- All walls shall have fasteners placed at 6 inches from ends of sill plates, with maximum spacing as shown in the table.
- 3. Fasteners indicated shall have two pins placed 6 inches and 10 inches, respectively, from each end of sill plates, with maximum spacing as shown in the table.
- All fasteners must be installed with a minimum 3/4-inch-diameter, No. 16 gauge (0.0598 inch) steel washer.
- Fasteners shall not be driven until the concrete has reached a compressive strength of 2,000 psi. Minimum edge distance is 1% inches.
- The fasteners shall not be used for the attachment of shear walls having a unit shear in excess of 100 pounds per foot. Spacings shown are independent of the number of building stories.

ANCHORING SYSTEMS

Concrete Anchors Designed to Meet 2006 IBC

Building Codes Are Changing – New Anchor Designs Now Required

Most states across the country have now adopted the 2006 International Building Code (IBC) and many jurisdictions within each state are now enforcing the new code. As a result, engineers and designers are increasingly being required to specify anchors designed and tested to meet the new requirements of the code. The 2006 IBC requires that Ultimate Strength Design methodology be used when designing structural anchorages within buildings and other structures. This affects how and when post-installed concrete anchors are specified and what products will be suitable for use.

When designing concrete anchorages, designers are now being required to consider, among other things, whether conditions exist that may cause the concrete to crack. If it's determined such conditions do exist, anchors designed and tested for use in cracked concrete must be specified. If it's determined there is no risk of concrete cracking, the designer may choose to specify anchors approved for use in uncracked concrete. In either case, Ultimate Strength Design methodology is required as part of the 2006 IBC.

Common conditions that cause cracking of concrete:

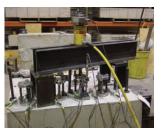

- Concrete in tension such as in the underside of a slab
- Concrete elements located in areas prone to seismic activity
- Other factors that contribute to cracking include:
 - External short term loads (such as high winds)
 - Temperature variations
 - · Shrinkage during curing

Simpson Strong-Tie Anchor Systems® has, for years, been at the forefront of developing anchors for use in both cracked and uncracked concrete. In fact, one of our test labs was the first lab in the U.S. to be accredited in testing on cracked concrete. We have devoted years of research, product development and extensive testing in the evolution of our cracked and uncracked concrete anchors. With our technical expertise and support you can rely on us to be the trusted source for concrete anchors.

ANCHORING SYSTEMS Anchoring Adhesives

SET-XP

SET-XP is a 1:1 two component, high solids epoxy-based anchoring adhesive formulated for optimum performance in both cracked and uncracked concrete. SET-XP has been rigorously tested in accordance with ICC-ES AC308 and 2006 IBC requirements and has proven to offer increased reliability in the most adverse conditions, including performance in cracked concrete under static and seismic loading. SET-XP is teal in color in order to be identified as a high performance adhesive for adverse conditions. Resin and hardener are dispensed and mixed simultaneously through the mixing nozzle. SET-XP exceeds the ASTM C881 specification for Type I and Type IV, Grade 3, Class C epoxy.

USES: When SET-XP is used with the IXP anchor, all thread rod, or rebar, the system can be used in tension and seismic zones where there is a risk of cracks occurring that pass through the anchor location. It is also suitable for uncracked concrete conditions.

CODES: ICC-ES ESR-2508; City of L.A. pending; Florida FL 11506.5 NSF/ANSI Standard 61 (216 in²/1000 gal)

IXP™ ANCHOR

The Simpson Strong-Tie IXP anchor is a torque-controlled adhesive anchor that, when used with Simpson Strong-Tie® SET-XP epoxy, provides optimum performance in both cracked and uncracked concrete under a variety of adverse service conditions. The IXP anchor was rigorously tested according to ICC-ES AC308 and 2006 IBC requirements. The unique conical shape of the helix configuration enables the IXP anchor to mimic the follow-up expansion behavior of a torque-controlled expansion anchor when tension-zone cracks in the base material intersect the anchor location.

CODES: ICC-ES pending

SET EPOXY-TIE®

SET Epoxy-Tie epoxy is a two-component, 1:1 ratio, high solids epoxy-based adhesive for use as a high strength, non-shrink anchor grouting material. Resin and hardener are dispensed and mixed simultaneously through the mixing nozzle. SET meets or exceeds the ASTM C-881 specification for Type I, II, IV and V, Grade 3, Class B and C.

CODES: ICC-ES ESR-1772 (CMU & URM); City of L.A. RR25279; Florida FL 11506.4; Caltrans approved; multiple DOT listings; NSF/ANSI Standard 61 (216 in²/1000 gal), except SET1.7KTA. SET-PAC-EZ™ covered by ICC-ES, City of L.A. and NSF/ANSI listings only

ET EPOXY-TIE®

ET Epoxy-Tie is a two-component, high solids epoxy-based system for use as a high strength, non-shrink anchor grouting material. Resin and hardener are dispensed and mixed simultaneously through the mixing nozzle. ET meets the ASTM C-881 specifications for Type I, II, IV and V, Grade 3, Classes B and C, except gel time.

CODES: ICC-ES ER-4945 (URM); City of L.A. RR25185, RR25120; Florida FL 11506.2; Multiple DOT Listings

AT ACRYLIC-TIE®

Acrylic-Tie is a two component, high solids, 10:1 ratio acrylic based adhesive for use as a high strength, anchor grouting material. Formulated for use in all types of weather, AT is designed to dispense easily and cure at temperatures down to 0°F. Resin and initiator are dispensed and mixed simultaneously through the mixing nozzle. AT meets the physical requirements of ASTM C881, Type I & IV, Grade 3, Classes A, B & C, except Acrylic-Tie is a non-epoxy product formulated for fast cure time.

CODES: ICC-ES ER-5791* (CMU & URM); City of L.A. RR25459*; Florida FL 11506.1*; NSF/ANSI Standard 61 (11 in²/5000 gal); Multiple DOT listings

*Applies to all AT products except AT10

ANCHORING SYSTEMS Mechanical Anchors

TITEN HD® Heavy Duty Screw Anchor

The Titen HD anchor is a patented, high-strength screw anchor for concrete and masonry. It is designed for optimum performance in both cracked and uncracked concrete; a requirement that the 2006 IBC places on post-installed anchors. The high strength, easy-to-install Titen HD anchor has been tested and shown to provide outstanding performance in cracked and uncracked concrete under both static and seismic-loading conditions. The self-undercutting, non-expansion characteristics of the Titen HD anchor make it ideal for structural applications, even at reduced edge distances and spacings. Recommended for permanent dry, interior non-corrosive environments or temporary outdoor applications.

CODES: ICC-ES ESR-2713 (concrete); ICC-ES ESR-1056 (CMU); City of L.A. RR25560; Florida FL 11506.7; Factory Mutual 3017082

U.S. Patent 5,674,035 & 6,623,228

STRONG-BOLT™ Wedge Anchor

The Strong-Bolt is a wedge anchor specifically designed for optimum performance in both cracked and uncracked concrete; a requirement that the 2006 IBC places on post-installed anchors. Rigorously tested according to the latest industry-wide criteria, the Strong-Bolt anchor is proven to offer increased reliability in the most adverse conditions, including performance in cracked concrete under static and seismic loading. The proprietary tri-segmented clip has dual undercutting embossments on each segment which enable secondary or "follow-up" expansion if a crack forms and intersects the anchor location. This significantly increases the ability of the Strong-Bolt wedge anchor to carry load if the hole opened slightly due to a crack. The Strong-Bolt anchor sets like a standard wedge anchor and is available in Imperial fractional sizes.

CODES: ICC-ES ESR-1771; City of L.A. RR25705; Florida FL 11506.6

WEDGE-ALL® Wedge Anchor

The Wedge-All anchor is a non-bottom bearing, wedge style expansion anchor for use in solid concrete or grout filled masonry. A one-piece clip ensures uniform holding capacity that increases as tension is applied. The threaded stud version is available in eight diameters and multiple lengths. A single size tie-wire version is available for wire supported fixtures. Threaded studs are set by tightening the nut. Tie-wire anchors are set with the claw end of a hammer

CODES: ICC-ES ESR-1396 (CMU); City of L.A. RR24682; Factory Mutual 3017082 and 3031136; Florida FL 11506.8; Underwriters Laboratories File Ex3605; Meets requirements of Federal Specifications A-A-1923A, Type 4. The Tie-Wire anchor is not code listed.

TORQ-CUT™ Self-Undercutting Anchor

The Torq-Cut self-undercutting anchor is a heavy-duty, high-capacity anchor designed and tested for use in cracked and uncracked concrete under static and seismic loading conditions. It is designed to meet the requirements that the 2006 IBC places on post-installed anchors. The built in ring with hardened cutters expands with installation torque forming undercut grooves in the concrete. This interlocking connection between the anchor and the concrete provides superior load carrying capacity.

CODES: ICC-ES pending

HDU Holdown This pro

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

HDU Holdowns are pre-deflected during the manufacturing process, virtually eliminating deflection under load due to material stretch. They use Simpson Strong-Tie® Strong-Drive® screws (SDS) which install easily and provide reduced fastener slip. Using SDS screws results in a greater net section, when compared to bolts, as no material is removed.

The HDU series of holdowns are designed to replace previous versions of the product such as PHD's as well as bolted holdowns. The HDU2, 4 and 5 are direct replacements for the PHD2, 5 and 6, respectively.

For more information on holdown options, contact Simpson Strong-Tie.

SPECIAL FEATURES:

- Pre-deflected body virtually eliminates deflection due to material stretch.
- Uses SDS screws which install easily, reduce fastener slip, and provide a greater net section area of the post compared to bolts.
- SDS screws are supplied with the holdowns to ensure proper fasteners are used.
- No stud bolts to countersink at openings.

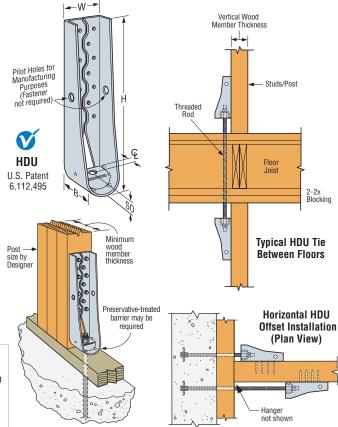

MATERIAL: See table FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- For use in vertical and horizontal applications.
- · No additional washer required.
- To tie multiple 2x members together, the Designer must determine the fasteners required to join the members to act as one unit without splitting the wood. See page 20 for SDS values.
- See SB and SSTB Anchor Bolts on pages 27-29 for anchorage options.
- SDS screws install best with a low speed high torque drill with a %" hex head driver.
- Refer to technical bulletin T-ANCHORSPEC for post-installed anchorage solutions (see page 191 for details).

CODES: See page 12 for Code Reference Key Chart.

For holdowns, per ASTM test standards, anchor bolt nut should be finger-tight plus 1/2 to 1/2 turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken to not over-torque the nut. Impact wrenches should not be used.

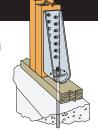

See footnote 7

- Allowable loads have been increased for earthquake or wind load durations with no further increase allowed; reduce where other load durations govern.
- The Designer must specify anchor bolt type, length and embedment. See SB and SSTB Anchor Bolts (pages 27-29). Refer to technical bulletin T-ANCHORSPEC for retrofit anchor solutions (see page 191 for details).
- Structural composite lumber columns have sides that show either the wide face or the
 edges of the lumber strands/veneers. Values in the tables reflect installation into the
 wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge)
 (see page 191 for details).
- 4. Post design by Specifier. Allowable load values are based on a minimum wood member thickness in the direction of the fastener penetration. Posts may consist of multiple 2x members provided they are designed to act as one unit independently of the holdown
- fasteners. Holdowns shall be installed centered along the width of the attached post.
- 5. Tension values are valid for holdowns flush or raised off of sill plate.
- 6. Deflection at Highest Allowable Tension Load includes fastener slip, holdown elongation, and anchor bolt elongation (L = 6"). Additional elongation of anchor bolts shall be accounted for by the Designer when holdowns are raised higher than 6".
- 7. Tabulated loads may be doubled when the HDU is installed on opposite sides of the wood member provided either the post is large enough to prevent opposing holdown screw interference or the holdowns are offset to eliminate screw interferences.
- 8. Noted HDU14 allowable loads are based on a 51/2" wide post (6x6 min.). All other loads are based on 31/2" wide post minimum.
- 9. Requires heavy hex anchor nut to achieve tabulated loads (supplied with holdown).

The PHD Series of pre-deflected holdowns are being replaced by HDU holdowns. For specifications that call for a PHD, contact Simpson Strong-Tie for equivalent HDU models. See above for details on the HDU series of pre-deflected holdowns.

Vertical HDU Installation

HDQ8/HHDQ Holdowns

The HHDQ series of holdowns combines low deflection and high loads with ease of installation. The unique seat design of the HDQ8 greatly minimizes deflection under load. Both styles of holdown employ the Simpson Strong-Tie® Strong-Drive® screws (SDS) which install easily, reduce fastener slip and provide a greater net section area of the post when compared to bolts. They may be installed either flush or raised off the mudsill without a reduction in load value.

- · Uses SDS screws which install easily, reduce fastener slip, and provide a greater net section area of the post compared to bolts.
- SDS screws are supplied with the holdowns to ensure proper fasteners are used.
- · No stud bolts to countersink at openings.

MATERIAL: HDQ8—7 gauge; HHDQ—Body: 7 gauge, washer: 1/2" plate FINISH: HDQ8—Galvanized; HHDQ— Simpson Strong-Tie® gray paint INSTALLATION: • Use all specified fasteners. See General Notes.

- For use in vertical and horizontal applications.
- · No additional washer is required.
- To tie multiple 2x members together, the Designer must determine the fasteners required to join members to act as one unit without splitting the wood. See page 20 for SDS values.
- See SB and SSTB Anchor Bolts on pages 27-29 for anchorage options.
- SDS screws install best with a low speed high torque drill with a 3/8" hex head driver.
- · Refer to technical bulletin T-ANCHORSPEC for post-installed anchorage solutions (see page 191 for details).

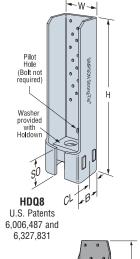

HDQ8:

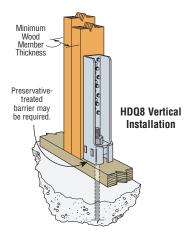

- 5/8" of adjustability perpendicular to the wall.
- See SSTB Anchor Bolts, page 28-29, for anchorage options. For 2-2x and 3x sill plates use SSTBL models. The Designer may specify any alternate anchorage calculated to resist the tension load for a specific job. Anchorage length should take the bearing plate/washer height into account, to ensure adequate length of threads to engage the nut.

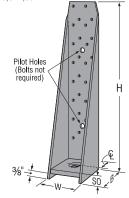

HHDQ11/14:

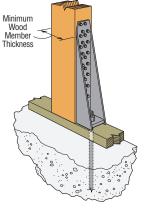

- · No additional washer is required.
- HHDQ14 requires a heavy hex anchor nut (supplied with holdown)
- See SB Anchor Bolts, page 27, for anchorage options.

CODES: See page 12 for Code Reference Key Chart.

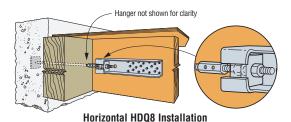

HHDQ11 (HHDQ14 similar)

Vertical HHDQ11 Installation (HHDQ14 similar)

For holdowns, per ASTM test standards, anchor bolt nut should be finger-tight plus 1/3 to 1/2 turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken to not over-torque the nut. Impact wrenches should not be used

- 1. Allowable loads have been increased for earthquake or wind load durations with no further increase allowed; reduce where other load durations govern.
- 2. The Designer must specify anchor bolt type, length and embedment. See SB and SSTB Anchor Bolts (pages 27-29). Refer to technical bulletin T-ANCHORSPEC for retrofit anchor solutions (see page 191 for details).
- 3. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details).
- 4. Post design by Specifier. Allowable load values are based on a minimum wood member thickness in the direction of the fastener penetration. Posts may consist of multiple 2x members provided they are designed to act as one unit independently of the holdown fasteners. Holdowns shall be installed centered along the width of the attached post.
- 5. Tension values are valid for holdowns flush or raised off of sill plate.
- 6. Deflection at Highest Allowable Tension Load includes fastener slip, holdown elongation, and anchor bolt elongation (L = 6"). Additional elongation of anchor bolts shall be accounted for by the Designer when holdowns are raised higher than 6".
- 7. Tabulated loads may be doubled when the HDQ8 is installed on opposite sides of the wood member provided either the post is large enough to prevent opposing holdown screw interference or the holdowns are offset to eliminate screw interferences.
- 8. Noted HHDQ14 allowable loads are based on a 51/2" wide post (6x6 min.). All other loads are based on 31/2" wide post minimum.
- Requires heavy hex anchor nut to achieve tabulated loads (supplied with holdown).
- 10. HHDQ holdowns installed horizontally can achieve compression loads with the addition of a standard nut on the underside of the load transfer plate. Refer to ESR 2330 for design values. Design of anchorage rods for the compression force shall be per the Designer.

HDC Concentric Holdown

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The unique design of the HDC holdowns eliminate eccentricity. They install with Simpson Strong-Tie® Strong-Drive® screws (SDS) (included) to reduce slip and provide a greater net section area of the post compared to bolts.

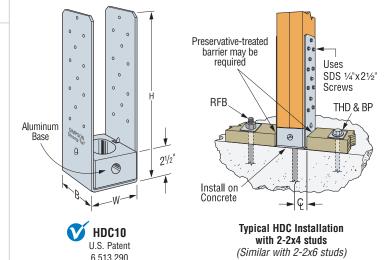

MATERIAL: 10 gauge strap

FINISH: Galvanized strap, aluminum base

INSTALLATION: • Use all specified fasteners. See General Notes.

- · Install on concrete.
- For use in vertical and horizontal applications.
- Sized for 2-2x, and 4x. Center 2-2x posts on holdown.
- Uses SDS screws supplied with the holdowns to ensure proper fasteners are used.
- Slot in the seat allows for %" of adjustment perpendicular to plate.
- Cut washer required between base and anchor nut. For HDC5 models use a standard cut washer. For HDC10 models use narrow cut washer with outside diameter of 13/4".
- · Witness slot in the base to inspect the nut .
- Maximum anchor bolt height above concrete is 21/8".
- To tie multiple 2x members together, the Designer must determine the fasteners required to join members to act as one unit without splitting the wood. See page 20 for SDS values.
- Aluminum standoff cannot be in contact with preservativetreated wood.
- SDS screws install best with a low speed high torque drill with a %" hex head driver.
- Refer to technical bulletin T-ANCHORSPEC for post-installed anchorage solutions (see page 191 for details).

CODES: See page 12 for Code Reference Key Chart.

For holdowns, per ASTM test standards, anchor bolt nut should be finger-tight plus ½ to ½ turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be taken to not over-torque the nut. Impact wrenches should not be used.

Model No.	Post Size	w	Н	В	ę	Anchor Bolt	Number of SDS 14"x21/2"	Allowable Tension Loads DF/SP (160)	Allowable Tension Loads SPF/HF (160)	Concrete Bearing ^{4,5} @ 2500 psi	Holdown Deflection at Highest Allowable Design Load	Code Ref.

- The Designer must specify anchor bolt type, length and embedment.
 See SB Anchor Bolts (page 27). Refer to technical bulletin
 T-ANCHORSPEC for retrofit anchor solutions (see page 191 for details).
- Loads are based on static tests on wood studs, limited by the lowest of 0.125" deflection, tested lowest ultimate divided by 3, or the wood screw value.
- Deflection at Highest Allowable Tension Load includes fastener slip, holdown elongation, and anchor bolt elongation (L = 6"). Additional elongation of anchor bolts shall be accounted for by the Designer when holdowns are raised higher than 6".
- 4. The HDCs will be limited by wood compression capacity if installed on
- a sill plate. HDC5/22 and HDC10/22 will achieve an allowable load of
- 4005 lbs. on a DFL plate. HDC5/4 and HDC10/4 will achieve an allowable load of 4940 lbs. on a DFL plate, which does not take deflection into account. Full tension values apply when installed on a sill, deflections may be higher.
- Higher values may be obtained when HDC is not placed at an edge or with f'c concrete strength > 2500 psi.
- Structural composite lumber columns have sides that show either the wide face or the
 edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face.
 See technical bulletin T-SCLCOLUMN for values on the narrow face (edge)
 (see page 191 for details).
- 7. Post design shall be by Designer.

RP6 Retro Plate

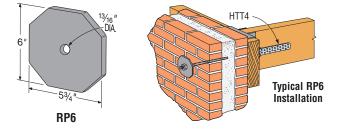

The RP6 retrofit plate fits on the outside of masonry buildings, and helps tie the walls to the roof or floor structure with a ¾" diameter rod.

FINISH: Simpson Strong-Tie® gray paint. Optional hot-dip galvanized coating; see Corrosion Information, page 10-11, and specify HDG.

MATERIAL: 3/8" Steel

Available with additional corrosion protection. Check with Simpson Strong-Tie.

INSTALLATION: Use a 3/4" diameter rod.

LTT/MTT/HTT Tension Ties

Tension ties offer a solution for resisting tension loads that is fastened with nails. The entire line of tension ties has been tested and evaluated to the requirements of AC155.

NEW! The HTT4 and HTT5 are the latest generation of tension ties. They feature an optimized nailing pattern which results in better performance with less deflection. Designed to meet new code standards, the HTT4 and HTT5 offer higher loads than their predecessors the HTT16 and HTT22. For an added benefit, the HTT5 installs with 6 fewer nails than the HTT22.

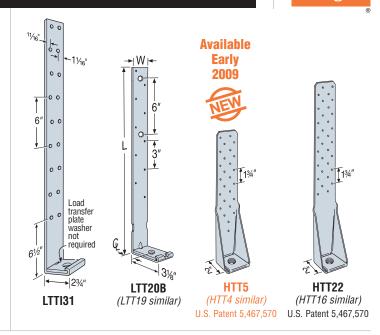

The LTT19 Light Tension Tie is designed for 2x joists or purlins and the LTT20B is for nail- or bolt-on applications. The 3" nail spacing makes the LTT20B suitable for wood I-joists with 10dx1½. The LTTI31 is designed for wood chord open web truss attachments to concrete or masonry walls and may also be installed vertically on a minimum 2x6 stud.

MATERIAL: See table

FINISH: Galvanized. May be ordered HDG; contact Simpson Strong-Tie. **INSTALLATION**: • Use all specified fasteners. See General Notes.

- For use in vertical and horizontal applications.
- To tie multiple 2x members together, the designer must determine the fasteners required to join members to act as one unit without splitting the wood. See page 20 for SDS values.
- Refer to technical bulletin T-ANCHORSPEC for post-installed anchorage solutions (see page 191 for details).

CODES: See page 12 for Code Reference Key Chart.

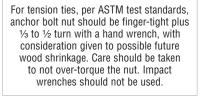

SIMPSON

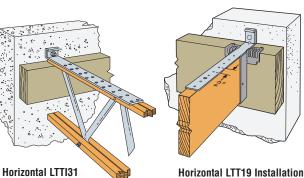

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- The Designer must specify anchor bolt type, length and embedment.
 See SB Anchor Bolts (page 27). Refer to technical bulletin
 T-ANCHORSPEC for retrofit anchor solutions (see page 191 for details).
- 2. Allowable loads have been increased for wind or earthquake load durations with no further increase allowed; reduce where other load durations govern.
- 3. Allowable loads are based on a minimum lumber thickness of 3"
- 4. If a ½" or 5/8" anchor bolt is used for the LTT19 or LTT20B, add a standard cut washer to the seat. No additional washer is required for a 3/4" anchor bolt. See table for appropriate anchor bolt sizes.
- 5. If the base of the LTTI31 is installed flush with a concrete or masonry wall, then the allowable load is 2285 lbs.
- 6. Tension values are valid for holdowns flush or raised off of sill plate.
- Allowable tension load with a bearing plate washer BP5/8-2 (sold separately) is 5395 lbs. for HTT5 and 4265 lbs. for HTT22
- 8. Deflection at Highest Allowable Tension Load includes fastener slip, holdown elongation, and anchor bolt elongation (L = 6"). Additional elongation of anchor bolts shall be accounted for by the Designer when holdowns are raised higher than 6".
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details).
- 10. **NAILS:** $16dx2\frac{1}{2} = 0.162^{"}$ dia. x $2\frac{1}{2}^{"}$ long. 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

Holdowns & Tension Ties

Allowable loads for HDA Holdowns have traditionally been limited by the calculated value of their stud bolts. Preliminary testing to the new acceptance criteria for testing and evaluating holdowns (AC 155) indicates that the ultimate capacity divided by a factor of safety exceeds the previously calculated values; however. the allowable loads are limited by deflection under the new critieria. Since significantly lower deflections are obtained with comparable SDS-style holdowns we recommend the use of the HDU series of holdowns (see page 37). For those conditions which necessitate a bolted holdown our existing HD product line provides the best alternative for high loads at low deflection.

HD Holdowns

HD holdowns provide a bolted holdown solution.

NEW! The HD19 is a high-capacity bolted holdown designed for applications that require loads beyond the capacity of the HDU series holdowns. The HD19 can be installed back-to-back when maximum capacity is needed or when eccentricity is an issue.

The HD9, HD12 and HD19 holdowns are self-jigging, ensuring that the code required minimum of seven bolt diameters from the end of the post is met. The HD5 and 7 must be raised such that the seven bolt diameter minimum from the end of the post is maintained. MATERIAL: See table FINISH: Simpson Strong-Tie® gray paint INSTALLATION: • Use all specified fasteners. See General Notes.

- For use in vertical and horizontal applications.
- HD holdowns are required to be installed such that the bottom stud bolt is a minimum of seven bolt diameters from the end of the post (2005 NDS, Section 11.5.1) which is indicated by the dimension in the drawing labeled (HB). HD9, 12 and 19 holdowns are self-jigging, ensuring that the code required minimum of seven bolt diameters from the end of the post is met. The HD5 and 7 must be raised such that the seven bolt diameter minimum from the end of the post is maintained (refer to table for HB dimension).
- Bolt holes shall be a minimum of 1/32" to a maximum of 1/16" larger than the bolt diameter (per NDS, section 11.1.2).
- Standard cut washer required between nut and base when using smaller diameter anchor bolts (see footnote 11).
- Stud bolts should be snugly tightened with standard cut washers between the wood and nut (BP's are required in the City of Los Angeles).
- The Designer must specify anchor bolt type, length, and embedment. See SB and SSTB Anchor bolts (pages 27-29).
- To tie multiple 2x members together, the Designer must determine the fasteners required to join members to act as one unit without splitting the wood (see page
- s).

member Washers must 0 be installed between bolt nuts and wood foonote 11 Stand off provides minimum end distance to end of post from post bolt HD7 (HD5 similar) Vertical HD19 Installation Minimum wood member thickness Washers must be installed between bolt nuts and wood **HD19** (HD9 and HD12 similar) Holdown must be raised off For holdowns, per ASTM test standards, of sill anchor bolt nut should be finger-tight plus 1/3 to 1/2 turn with a hand wrench, with consideration given to possible future wood shrinkage. Care should be Vertical HD7 taken to not over-torque the nut. Installation Impact wrenches should not be used. (HD5 similar)

- 1. Allowable loads have been increased for earthquake or wind load durations with
- no further increase allowed; reduce where other load durations govern.

 2. HD12 and HD19 require a minimum 4x8 (in a 3½" wide shearwall) or 6x6 nominal post to ensure the tension load carrying capacity of the critical net section meets the holdown capacity. Designer to evaluate combined bending and tension stresses.
- 3. HB is the required minimum distance from the end of the stud to the center of the first stud bolt hole. End distance may be increased as necessary for installation (see General Notes). Tension values are valid for holdowns installed flush to, or raised off of, the sill plate provided that the minimum HB distance is maintained.
- The Designer must specify anchor bolt type, length and embedment.
 See SB and SSTB Anchor Bolts (pages 27-29). Refer to technical bulletin T-ANCHORSPEC for retrofit anchor solutions (see page 191 for details).
- 5. Lag bolts will not develop the listed loads.
- 6. Deflection at Highest Allowable Tension Load includes fastener slip holdown elongation, and anchor bolt elongation (L = 8"). Additional elongation of anchor bolts

- shall be accounted for by the Designer when holdowns are raised higher than 8".
- 7. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details).
- 8. To achieve published loads, machine bolts shall be installed with the nut on the opposite side of the holdown (see drawing). If reversed, the Designer shall reduce the allowable loads shown per NDS requirements when bolt threads are in the shear plane.
- 9. For SPF/HF allowable loads use 0.85 of the DF/SP allowable loads.
- 10. Tabulated values may be doubled when the HD holdown is installed on opposite sides of the wood member. The Designer must evaluate the capacity of the wood member and the anchorage
- Standard cut washer required under anchor nut for HD5 with 5%" anchor and HD7, HD9 and HD12 with 7/8" or 1" anchors. HD19 requires a cut washer with 11/8" anchors
- 12. Post design shall be by Designer. Tabulated loads are based on 31/2" wide post minimum.

LSTHD/STHD Strap Tie Holdown WEINEERED

SIMPSON

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The STHD is an embedded strap tie holdown with high load capacity and a staggered nail pattern to help minimize splitting. The STHD strap tie holdown incorporates many features that improve installation and function. When used in conjunction with the StrapMate® you have a system that helps prevent both parallel and perpendicular movement during installation relative to the form. Allows for accurate location of the STHD's and reduces the possibility of spalling.

FEATURES

- The strap nailing pattern allows for nailing to the edges of double 2x's.
- · A slot below the embedment line allows for increased front to back concrete bond and reduced spalling.
- Strap nail slots are countersunk to provide a lower nail head profile.
- Rim joist models accommodate up to a 17" clear span without any loss of strap nailing.

MATERIAL: LSTHD8, LSTHD8RJ—14 gauge, all others—12 gauge

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- See Post Tension information on page 43.
- Install before concrete pour with a StrapMate, or other holding device.
- · Nail strap from the bottom up.
- Strap may be bent one full cycle (bent horizontal 90° then bent vertical) to aid wall placement, but may cause spalling behind the strap. If the spall is 1" or less, measured from the embedment line to the bottom of the spall, full loads apply. For larger spalls see table footnotes for load reduction. Any portion of the strap left exposed should be protected against corrosion.
- For two pour installations spalling is measured from the first pour.
- Unless otherwise noted, do NOT install where: (a) a horizontal cold joint exists within the embedment depth between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load, or the slab is designed to resist the load imposed by the anchor; or (b) slabs are poured over concrete block foundation walls.
- To tie multiple 2x members together, the Designer must determine the fasteners required to join members to act as one unit without splitting the wood.
- Additional studs attached to the shearwall studs or post may be required by the Designer for wall sheathing nailing.
- · Wood shrinkage after strap installation across horizontal members may cause strap to buckle outward.

CODES: See page 12 for Code Reference Key Chart.

- 1. 'RJ' after the model indicates STHDs for rim joist applications, e.g. STHD8RJ.
- 2. STHD14RJ on 8" stemwall requires 30-16d sinkers.
- 10d commons nails may be used with no load reduction.
- Minimum nail end distance to prevent splitting is 10 x diameter, 1½" for 16d sinkers and 10d common.
- 5. For two pour with 4" slab or less. The STHD14 load at 1/2" end distance 2000 psi is 3235 lbs. and 4220 lbs. at 14" end distance. The STHD10 at the same condition is 2035 lbs. for ½" end distance, and 2750 lbs. at 10" end distance.
- 6. Allowable loads have been increased for wind or earthquake load durations with no further increase allowed; reduce where other load durations govern.
- 7. Where fewer fasteners are used in the structural wood member, reduce loads according to the code
- 8. To get the full table load, the minimum center-to-center spacing is twice the embedment depth when resisting tension loads at the same time.
- 9. There is an increase in the amount of deflection if the strap is installed on the outside of the shear panel instead of directly to the framing. Refer to technical bulletin T-PLYWOOD (see page 191 for details).

- 10. Calculate loads using straight line interpolation for corner distances between ½" and le.
- 11. STHD14RJ installed on HF/SPF in an 8" stemwall: the le load is 5370 lbs.
- 12. Post design shall be by Designer.
- 13. Loads shown apply to post tension slabs when one #4 rebar (minimum) is installed (per single pour rebar installation on page 43).
- 14. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details).
- 15. For concrete spalls between 1" and 4" the allowable loads is 0.90 of the table loads.

 16. Table loads apply to corner stemwall applications provided that there is a
- perpendicular stemwall at the corner having a minimum length of le. See page 43 for loads where there is not a perpenducular stemwall at corners.
- 17. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.
- 18. NAILS: 16d sinker = 0.148" dia. x 31/4" long. See page 16-17 for other nail sizes and information.

- 2. Allowable loads have been increased for wind or earthquake load durations with no further increase allowed; reduce where other load durations govern.
- 3. For dimensional information and required fasteners, refer to to table on page 42.
- 4. For STHD14 11/2" End Distance in 8" stemwalls, loads can be increased to 4200 lbs.
- 5. Allowable loads also apply to rim joist models.
- 6. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.

Single Pour Rebar Installation

*Maintain minimum rebar cover, per ACI-318 concrete code requirements.

Two Pour Rebar Installation

*Maintain minimum rebar cover, per ACI-318 concrete code requirements.

SPALL REDUCTION SYSTEM FOR STHD STRAP TIE HOLDOWN

FEATURES

- · Built-in tab.
- StrapMate® locator line.
- · Additional diamond hole in RJ versions.

BENEFITS

Built-in Tab:

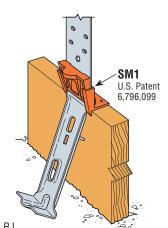

- · Reduces spalling and costly retrofits.
- · No additional labor to install.
- · Holds STHD away from form board.

StrapMate Locator Line:

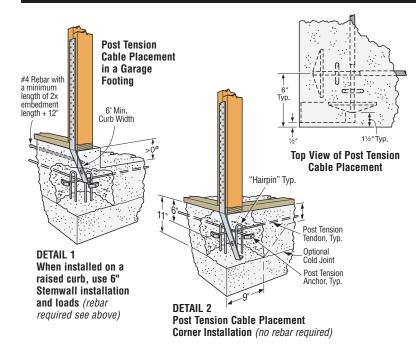

- Easy inspection to ensure proper location.
- Allows adjustment without removing STHD.

Additional Diamond Hole:

• One more fastener to help prevent the STHD RJ models from bowing out at the rim joist section.

- 1. Minimum concrete strength is 2500 psi. 2. Post-tension steel is minimum ½" diameter, 7-wire, low-relaxation strand in accordance with ASTM A416, Grade 270 ksi, with a guaranteed ultimate strength of 41.3 k.
- 3. Anchorage is monostrand-type anchor system with current ICC approval using a ductile iron casting of at least 2.25"x4.5" of bearing
- and reusable pocket formers on all stressing ends.

 4. It is the Designer's responsibility to provide reinforcement to tie cold-joints and to resist bending stresses in the foundation due to anchor uplift.

 5. Post design shall be by Designer.
- 6. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.
- 7. **NAILS:** 16d = 0.162" dia. x 3½" long, 16d sinker = 0.148" dia. x 3¼" long. See page 16-17 for other nail sizes and information.

PAHD/HPAHD Strap Tie Holdowns

SIMPSON Strong-Tie

Wood-to-concrete connectors that satisfy engineering and code requirements.

MATERIAL: HPA—10 gauge; all others—12 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes

- Install before concrete pour with a StrapMate®, or other holding device.
- Strap may be bent one full cycle. Bending the strap 90° to aid wall placement may cause spalling behind the strap. If the spall is 1" or less, measured from the embedment line to the bottom of the spall, full loads apply. For spalls between 1" and 4" (see illustration on page 45), the allowable load is 0.90 of the table loads.
- For two pour installations spalling is measured from the first pour.
- · Nail strap from bottom up.
- Where fewer fasteners are used in the structural wood member, reduce loads according to the code.
 A wood splitting problem may occur when holdowns are nailed to lumber less than 3½" wide. To lessen splitting of 3x's or double 2x's, either fill every nail hole with 10dx1½" nails or fill every other nail hole with 16d commons. Reduce the allowable load based on the size and quantity of fasteners used.
- Unless otherwise noted, do NOT install where: (a) a horizontal cold joint exists within the embedment depth between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load, or the slab is designed to resist the load imposed by the anchor; or (b) slabs are poured over concrete block foundation walls
- To get the full table load, the minimum center-to-center spacing is twice the embedment depth when resisting tension loads at the same time.
- To tie multiple 2x members together, the Designer must determine the fasteners required to join members to act as one unit without splitting the wood.
- Additional studs attached to the shearwall studs or post may be required by the Designer for wall sheathing nailing

FOUNDATION CORNERS: Nail and bolt quantities have been reduced when the load is limited by tested concrete pullout strength (fill holes from bottom up); additional nail holes need not be filled. Nail and bolt quantities may be reduced further for less than 8" corner distance design loads—use code allowable loads for fasteners used in shear.

TWO-POUR SYSTEMS: When a cold joint exists between slab and foundation, the holdown will be lower on the stud wall since the embedded portion of the holdown must be in the foundation (see table footnote 1 for exception). Fewer fasteners are used, reducing allowable loads. Loads are calculated using a 4" slab over 6" and 8" foundation walls.

PAHD42, HPAHD22-4P HOLDOWNS: Designed to be installed at the edge of concrete. Tests determined the pullout strength with one horizontal #4 rebar in the shear cone. Rebar should be a minimum length of 2x embedment depth + 12" (except corner installations, page 45). Install before pouring concrete by nailing to form. Installation holes allow nailing to the form, resulting in 1" deeper embedment; see illustration.

Allowable Tension Loads DF/SP (160)

End Distance

Embedment Line (Top of Concrete) Part 13/4" Typ. 241/6" Co 11/4" Typ. 221/16" 221/16" 243/8" HPAHD22
6 ¹ / ₄
HPAHD22-2P

1. HPAHD22 may be embedded 4" into the slab and 6" into the 8" stemwall beneath for a maximum load of 2810 lbs. at 8" minimum from the closest corner, and 1200 lbs. at 1/2" from the closest corner (like installation 4).
Allowable loads have been increased for wind or earthquake

load durations with no further increase allowed; reduce where

other load durations govern.

16d sinkers (0.148" dia. x 31/4" long) or 10d commons may be substituted for specified 16d commons at 0.85 of table loads.

Minimum nail end distance to prevent splitting is 10x the nail diameter, or 15/8" for 16d nails.

Calculate loads using straight line interpolation for corner distances between ½" and 8".

Optional fastener holes are provided on selected products. Because the product is limited by the concrete foundation, you may not need to install optional fasteners. Strap may be bent one full cycle. (Bent horizontal 90°

then bent vertical.)

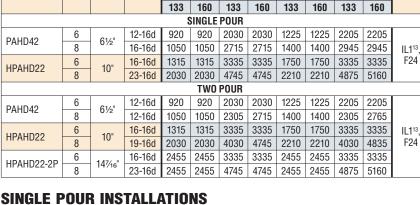

Rim Joist application: see Installation 3 for corner condition. Loads shown apply to post-tension slabs when one #4 rebar (minimum) is installed as shown on page 45.

Post design shall be by Designer.
For SCL columns the PAHD/HPAHD straps should be used into the wide face only.

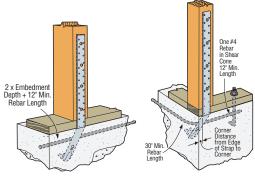

There is an increase in the amount of deflection if the strap

is installed on the outside of the shear panel instead of directly to the framing. Refer to technical bulletin T-PLYWOOD (see page 191 for details).
Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads

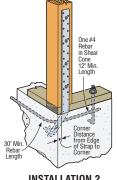

and information. 13. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

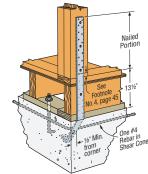

2000 psi Concrete

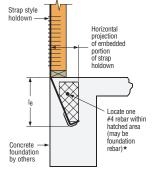

INSTALLATION 1 Typical HPAHD Single Pour Edge Installation

INSTALLATION 2 Typical HPAHD Single Pour **Corner and Endwall Installation**

INSTALLATION 3 Typical HPAHD Single Pour Rim Joist Installation (Reduce allowable load based on quantity of effective nails used.)

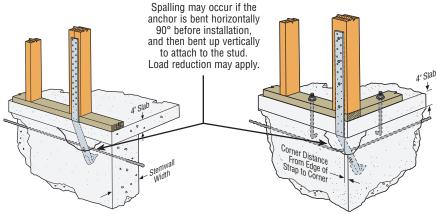

Single Pour Rebar Installation *Maintain minimum rebar

cover. per ACI-318 concrete code requirements.

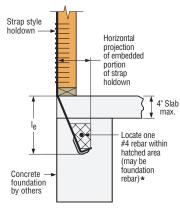

PAHD/HPAHD Strap Tie Holdowns

TWO POUR INSTALLATIONS

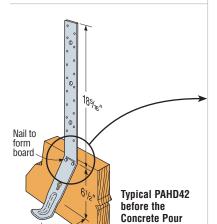

INSTALLATION 4 Typical HPAHD22-2P Two Pour Edge Installation. Unless noted, install other models with bend embedment line at cold joint between slab and foundation.

INSTALLATION 5 Typical HPAHD **Two Pour Corner Installation**

Two Pour Rebar Installation *Maintain minimum rebar cover, per ACI-318 concrete code requirements.

SPALL REDUCTION SYSTEM FOR PAHD AND HPAHD

FEATURES

- · Secures holdown to wood form-board.
- · Allows for proper side-cover.
- · Keeps strap vertical.
- · Prevents tilting or twisting of strap during the concrete pour.
- Uses one 16d duplex nail.

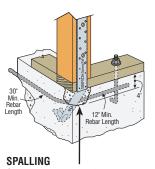

BENEFITS

- · Greatly reduces spalling and costly retrofits.
- Helps prevent strap movement parallel and perpendicular to plate.
- Decreases possibility of misinstallation of strap to wood member.
- Simple to use: Common jobsite nail.
 - No additional expense.

6,658,806

When using keyhole feature, care should be taken when removing form boards. If concrete is not set, the duplex nail will move the strap placement.

Spalling may occur if the anchor is bent horizontally 90° before installation, and then bent up vertically to attach to the stud. Load reduction may apply.

PA Strap Tie Holdowns

Wood-to-concrete connectors that satisfy engineering and code requirements.

MATERIAL: 12 gauge

FINISH: Galvanized or ZMAX® coating INSTALLATION: • Use all specified fasteners. See General Notes.

 Refer to technical bulletin T-PAUPLIFT (see page 191 for details) for additional information.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

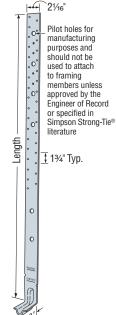

Model No.	L	Min. Embed. Depth	Nails	Allowable Uplift Loads (160)	Code Ref.
PA51	51	4	9-16d	2030	IL64
PA68	70	4	9-16d	2030	ILO.

- 1. Loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2.16d sinkers (9 ga x 31/4") or 10d commons may be substituted for the specified 16d commons at 0.84 of the table loads.
- 3. Optional fastener holes provided. Calculate loads according to the code to a maximum of 3685 lbs. Minimum embedment is 4"; 5" to the nearest edge.

4. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.

(PA68 similar)

PA51 (PA68 similar)

PA/HPA Purlin Anchors

installation in concrete or concrete block. MATERIAL: PA-12 gauge; HPA-10 gauge

FINISH: Galvanized, PA's available HDG or ZMAX® coating

INSTALLATION: • Minimum concrete strength is 2000 psi.

- Use all specified fasteners; some models have extra fastener holes. See General Notes.
- · Purlin Anchor must hook around rebar.
- Wood splitting may occur when anchor is nailed to wood less than 31/2" wide. For widths less than 31/2", see PAHD Holdowns for alternate nailing configurations, or PAI.

EDGE DISTANCE—Minimum concrete edge distance is 5".

Minimum concrete block left-to-right edge distance is 20".

CONCRETE BLOCK WALL—The masonry embedment line on the PA allows for 4" of grout embedment in a standard 8" concrete masonry unit.

The minimum wall specifications are:

- A One #4 vertical rebar, 32" long, 16" each side of anchor;
- B Two courses of grout filled block above and below the anchor (no cold joints allowed);
- C A horizontal bond beam with two #4 rebars, 40" long, a maximum of two courses above or below the anchor.

All cells grouted with 2000 psi %" aggregate grout. Grout shall be vibrated per the Code. Rebar quantities, sizes and lengths are minimum requirements and may be increased per any additional wall design requirements.

OPTIONS: See LTT and HTT Tension Ties for alternate retrofit solutions.

CODES: See page 12 for Code Reference Key Chart.

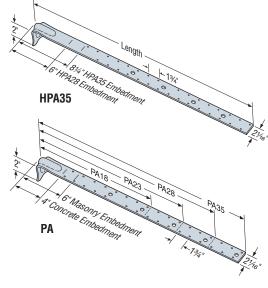

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Allowable loads are for a horizontal installation into the side of a concrete or masonry wall.
- 2. Minimum penetration for 16d commons is 115/16".
- 3. 16d sinkers (0.148" dia. x 31/4" long) or 10d commons may be substituted for the specified 16d commons at 0.85 of the table loads.
- 4. Allowable loads have been increased for earthquake or wind load durations with no further increase allowed; reduce where other load durations govern.
- 5. Strap may be bent one full cycle. (Bent horizontal 90° then bent vertical.)
- 6. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.
- 7. NAILS: 16d = 0.162" dia. x 3½" long. See page 16-17 for other nail sizes and information.

ASCE7-05 12.11.2.2.5 states:

... Diaphragm to wall anchorage using embedded straps shall have the straps attached to or hooked around the reinforcing steel, or otherwise terminated to effectively transfer forces to the reinforcing steel.

AB/ABA/ABE/ABU Adjustable and Standoff Post Bases

Additional standoff bases are on page 180.

The AB is an adjustable post base which offers moisture protection and finished hardware appearance.

These post bases feature 1" standoff height above concrete floors, code-required when supporting permanent structures that are exposed to the weather or water splash, or in basements. They reduce the potential for decay at post and column ends.

MATERIAL: AB-12 gauge plates; 16 gauge base cover; all others—see table

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

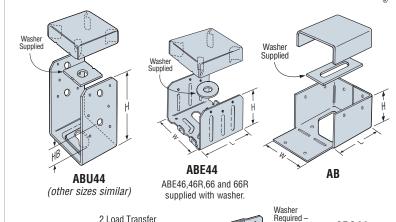

- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).
- · AB supplied as shown; position the post, secure the easyaccess nut over the supplied washer, place the standoff base, then bend up the fourth side and nail all sides.
- AB, ABA, ABE and ABU—for pre-pour installed anchors.
 For epoxy or mechanical anchors, select and install according to anchor manufacturer's recommendations; anchor diameter shown in table.
- · Products require washers between the nut and the base. Washers are supplied with all products except ABA's which require a standard cut washer.
- · Refer to technical bulletin T-ANCHORSPEC for postinstalled anchorage solutions (see page 191 for details).

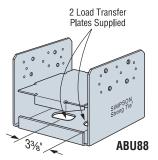

CODES: See page 12 for Code Reference Key Chart.

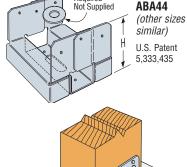

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Uplift loads have been increased for wind or earthquake load durations with no further increase allowed; reduce where other load durations govern.
- 2. Downloads may not be increased for short-term loading.
- 3. Specifier to design concrete for shear capacity.
- 4. ABU products may be installed with either bolts OR nails (not both) to achieve table loads. ABU88 and ABU88R may be installed with 8-SDS 1/4"x3" wood screws (sold separately) for the same table load.
- 5. For AB bases, higher download can be achieved by solidly packing grout under 1" standoff plate before installation. Base download on column, grout, or concrete according to the code.
- 6. HB dimension is the distance from the bottom of the post up to the first bolt hole.
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. For SCL columns, the fasteners for these products should always be installed in the wide face.
- 8. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

EPB44T/EPB44PHDG Elevated Post Bases

EPB44PHDG can be used both for pier block and cast-in-place installation

MATERIAL: 12 gauge base. EPB44T—Threaded rod support %"x5" (shipped assembled). EPB44PHDG—Threaded rod support %"x6", nut and washer are shipped assembled

FINISH: EPB44T: Base—Galvanized, Threaded Rod—Zinc Plate EPB44PHDG: HDG; see Corrosion Information, page 10-11.

INSTALLATION: • Secured with Epoxy: EPB44T—Drill a 34" hole 3" deep minimum into the concrete. Clean the hole and fill half full with epoxy (per installation instructions). Insert the EPB44T and adjust to the desired height. The threaded rod shall be embedded a minimum of 21/2". To adjust after the epoxy cures, drill a hole in the center of the post and rotate the post base up or down to the desired height.

EPB44PHDG—Drill a 7/6" diameter hole 4" deep minimum and fill the hole halfway with SET epoxy or drill a 13/16" diameter hole 4" deep minimum and fill the hole halfway with AT adhesive. Insert the EPB44PHDG and adjust to the desired height. The threaded rod shall be embedded a minimum of 31/2". Minimum sidecover is 3" from the center of the threaded rod for both products.

- Supported by a Nut: EPB44T—Drill a 3/4" hole 21/2" deep minimum into concrete. Install a 5%-11 NC nut and cut washer on the threaded rod. (Nut and washer not supplied). Insert EPB44T into the hole and adjust to the desired height. EPB44PHDG—Drill a 1" diameter hole 3½" deep minimum. Insert the EPB44PHDG and adjust to the desired height.
- Embedded in Wet Concrete: Embed 5%" rod minimum 4" embedment.
- . Minimum sidecover is 3" from the center of the threaded rod.
- · Fully engage at least three threads in the base.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

CODES: See page 12 for Code Reference Key Chart.

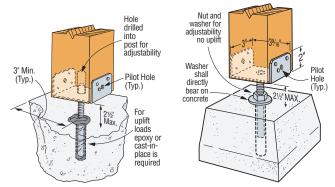

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

PB/PBS Regular and Standoff Post Bases

The PBS features a 1" standoff height. It reduces the potential for decay at post and column ends.

MATERIAL: PB—12 gauge; PBS—see table

FINISH: Galvanized. Some products available in ZMAX® or HDG coating; see Corrosion Information, page 10-11.

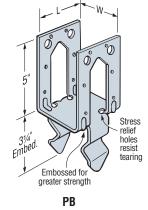

INSTALLATION: • Use all specified fasteners. See General Notes.

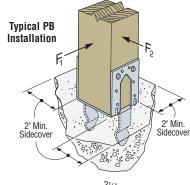

- Install either nails or bolts (see page 13, note d).
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).
- · PB: Holes are provided for installation with either 16d commons or 1/2" bolts for PB66 and PB66R; all other models use 16d commons only. A 2" minimum sidecover is required to obtain the full load.
- . PBS: Embed into wet concrete up to the bottom of the 1" standoff base plate. A 2" minimum side cover is required to obtain the full load. Holes in the bottom of the straps allow for free concrete flow.

OPTIONS: PBS available in rough sizes, contact Simpson Strong-Tie. CODES: See page 12 for Code Reference Key Chart.

- 1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. PBS—Downloads may not be increased for short-term loading
- 3. PBS—Designer to design concrete for shear capacity.
- 4. PBS—For higher downloads, solidly pack grout under 1" standoff plate before installing into concrete. Base download on column or concrete, according to the code.

 5. Downloads shall be reduced where limited by buckling capacity of the post.
- 6. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. For SCL columns, the fasteners for these products should always be installed in the wide face.
- 7. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.
- 8. NAILS: 16d = 0.162" dia. x 31/2" long. See page 16-17 for other nail sizes and information.

EPS4Z Column Bases

The EPS4Z provides a light-duty connector for attachment of posts to concrete. MATERIAL: 14 gauge

FINISH: ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

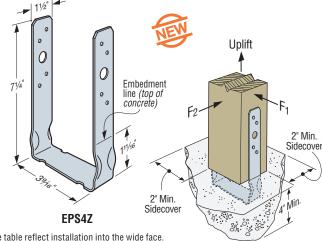

- · Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

 • Embed into wet concrete up to the embedment line.
- A 1" minimum side cover is required to obtain the full load.
- Posts shall be preservative-treated wood to meet building code requirements. **CODES:** See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model		Allow	able Loads (D	F/SP)	Code

- 1. Loads may not be increased for short-term loading.
- 2. Download capacity is based on either the post design or concrete design calculated per code.
- 3. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber
- strands/veners. Values in the table reflect installation into the wide face.
- 4. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.
- 5. NAILS: 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The CBSQ uses Simpson Strong-Tie® Strong-Drive® screws (SDS), which allow for fast installation, reduced reveal and high capacity, provides a greater net section area of the column compared to bolts.

MATERIAL: See table

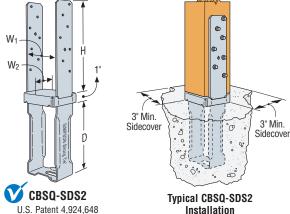

FINISH: Galvanized, available in HDG with HDG screws

INSTALLATION: • Use all specified fasteners. See General Notes.

- Install Simpson Strong-Tie SDS ½"x2" wood screws, which are provided with the column base. (Lag screws will not achieve the same load.)
- For full loads, a minimum of 3" side cover shall be provided.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

ORDERING: To order with screws, specify CBSQ-SDS2. To order without screws, specify CBSQ.

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. PSL is parallel strand lumber.
- 3. LCB products may be installed with either bolts <u>OR</u> nails (not both) to achieve table loads.
- 4. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details). LCB bases installed with nails must be installed into the wide face.
- 5. Designer is responsible for concrete design.
- 6. Testing to new ICC-ES acceptance criteria to be completed in 2009. Reference www.strongtie.com for latest loads and information.
- 7. NAILS: 16d = 0.162" dia. x 3½" long. See page 16-17 for other nail sizes and information.

(CB5, CB7 similar) for Glulam Column

BC/BCS Post Caps

The BCS allows for the connection of 2-2x's to a 4x post or 3-2x's to a 6x post. Double shear nailing between beam and post gives added strength! The BC series offers dual purpose post cap/base for light cap or base connections. MATERIAL: 18 gauge

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

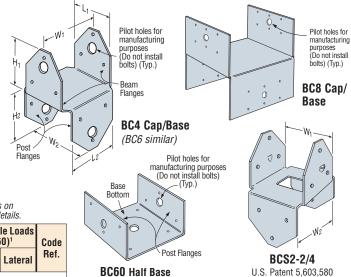

INSTALLATION: • Use all specified fasteners. See General Notes.

- · Do not install bolts into pilot holes.
- BCS: install dome nails on beam; drive nails at an angle through the beam into the post below to achieve the table loads
 BC: install with 16d commons or 16dx2½" joist hanger nails.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).
- To tie multiple 2x members together, the Designer must determine the fasteners required to join members to act as one unit without splitting the wood.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Loads may not be increased for short-term loading.

 Allowable loads are determined using the lowest of the bearing loads using F_C-perp equal to 425 psi for SPF, 625 psi for DF and 700 psi for LVL/PSL/LSL.
- Loads are for a continuous beam.
 Spliced conditions for the LCC must be detailed by the Designer to transfer tension loads between spliced members by means other than the lally column. The splice condition load is 6750 lbs per beam side for LCC must be evenly loaded. 5. To achieve lateral loads, the LCC pipe must be welded to the

- column with an 1/s" fillet weld around the entire pipe.
 6. The CCOS must be attached to end plate of the column with
 (4) Quik Drive XQ112S1224 self-tapping screws through the
 end plate and into the bottom of the CCOS.
- All pipe columns need to be designed by a qualified Designer. CCOS minimum column diameter is 3".
- 8. CCOS caps can resist out-of-plane (F₂) forces up to 2200 lbs. provided the beam is braced to resist torsional rotation.

 9. NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

SIMPSON

AC/ACE/LPCZ/LCE Post Caps

The LCE4's universal design provides high capacity while eliminating the need for rights and lefts. For use with 4x or 6x lumber. LPCZ—Adjustable design allows greater connection versatility.

MATERIAL: LCE4—20 gauge; AC, ACE, LPC4Z—18 gauge; LPC6Z—16 gauge

FINISH: Galvanized. Some products available in ZMAX® coating and stainless steel; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

 Install all models in pairs. LPCZ—2½" beams may be used if 10dx1½" nails are substituted for 10d commons.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Allowable loads have been increased for wind or earthquake load durations with no further increase allowed; reduce where other load durations govern.
- 2. Loads apply only when used in pairs.
- 3. LPCZ lateral load is in the direction parallel to the beam.
- MIN nailing quantity and load values—fill all round holes;
 MAX nailing quantities and load values—fill round and triangle holes.
- 5. Uplift loads do not apply to splice conditions.6. Spliced conditions must be detailed by the Designer to transfer tension loads between spliced members by means other than the post cap.

- 7. LCE4 uplift load for mitered corner conditions is 985 lbs. (DF/SP) or 845 lbs. (SPF).
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/
 veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the parrow face (edge) (see page 191 for details).
- on the narrow face (edge) (see page 191 for details).

 9. NAILS: 16d = 0.162' dia. x 3½" long, 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

PC/EPC Post Caps

PC and EPC caps provide a custom connection for post-beam combinations at medium design loads.

MATERIAL: PC-12 gauge; PC-16-16 gauge

FINISH: Galvanized. Some products available in ZMAX coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners; see General Notes.

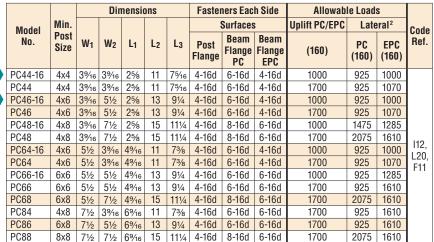

• Do not install bolts into pilot holes.

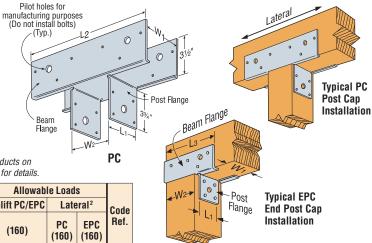

OPTIONS: • For end conditions, specify EPC post caps, providing dimensions are in accordance with table; see illustration.

- Some PC and EPC models are available in rough sizes.
- For heavy duty applications, see CC and CCQ series.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Allowable loads have been increased for wind or earthquake load durations with no further increase allowed; reduce where other load durations govern.
- 2. Lateral loads are in the direction parallel to the beam.
- 3. Allowable loads are for nails only.
- Uplift loads do not apply to splice conditions.
- Spliced conditions must be detailed by the Designer to transfer tension loads between spliced members by means other than the post cap.
- 6. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/ veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details).
- 7. **NAILS:** 16d = 0.162" dia. x 3½" long. See page 16-17 for other nail sizes and information.

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

Column caps provide a high capacity connection for column-beam combinations. This design uses Simpson Strong-Tie® Strong-Drive® screws (SDS) to provide faster installation and provides a greater net section area of the column compared to bolts. The SDS screws provide for a lower profile compared to standard through bolts.

MATERIAL: CCQ3, ECCQ3, CCQ4, ECCQ4, CCQ6, ECCQ6—7 gauge; all others—3 gauge

FINISH: Simpson Strong-Tie® gray paint, available in HDG;

CCOQ and ECCOQ—no coating

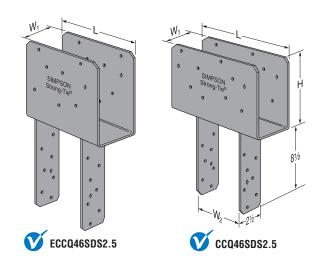

INSTALLATION:

- Install Simpson Strong-Tie SDS 1/4"x21/2" wood screws, which are provided with the column cap. (Lag screws will not achieve the same load.)
- CCOQ and ECCOQ column cap only (no straps) may be ordered for field-welding to pipe or other columns. Dimensions are same as CCQ and ECCQ. Load values do not apply.

OPTIONS:

- · For end conditions, specify ECCQ.
- Straps may be rotated 90° where $W_1 \ge W_2$.

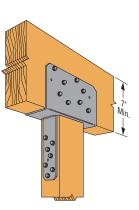

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Typical CCQ46SDS2.5 Installation

- Downloads are determined using Fc. equal to: 560 psi for glulam sizes and 625 psi for all others; reduce where end grain bearing or buckling capacity of the column, or other criteria are limiting.
- Spliced conditions must be detailed by the Designer to transfer tension loads between spliced members by means other than the column cap.
- 3. Uplift loads do not apply to splice conditions.
- 4. Post sides are assumed to lie in the same vertical plane as the beam sides.
- 5. Loads may not be increased for short-term loading.
- Uplift loads have been increased for wind or earthquake load durations with no further increase allowed; reduce where other load durations govern.
- 7. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details).
- 8. ECCQ uses 14-SDS screws into the beam and 14-SDS screws into the post.
- 9. Beam depth must be a minimum 7'
- 10. For 51/4" engineered lumber, use CCQ 6X or ECCQ 6X models.

CC/ECC/ECCU Column Caps

Column caps provide a high capacity connection for column-beam combinations.

MATERIAL: CC314, CC44, CC46, CC48, CC64, CC66, CC68, CC6-71/8, ECC31/4, ECC44, ECC46, ECC48, ECC64, ECC66, ECC68, ECC6-71/8—7 gauge; all others—3 gauge

FINISH: Simpson Strong-Tie® gray paint; may be ordered HDG; CCO, ECCO—no coating INSTALLATION: • Use all specified fasteners. See General Notes.

- Bolt holes shall be a minimum of 1/32" to a maximum of 1/16" larger than the bolt diameter (per 2005 NDS, section 11.1.2).
- Contact engineered wood manufacturers for connections that are not through the wide face.

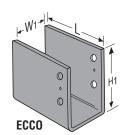

OPTIONS: • Straps may be rotated 90° where W₁≥W₂ (see illustration).

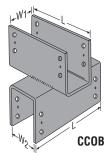

- For special, custom, or rough cut lumber sizes, provide dimensions. An optional W₂ dimension may be specified with any column size given (note that the W₂ dimension on straps rotated 90° is limited by the W₁ dimension).
- CCO/ECCO—Column cap only (no straps) may be ordered for field-welding to pipe or other columns. No loads apply. CCO/ECCO dimensions are the same as CC/ECC.

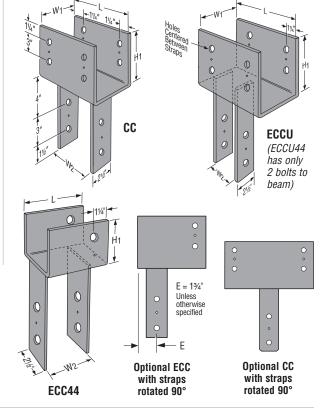

CCOB—Any two CCOs may be specified for back-to-back welding to create a cross beam connector. Use the table loads; the load is no greater than the lesser element employed.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Post sides are assumed to lie in the same vertical plane as the beam sides. 2. Loads may not be increased for short-term loading.
- Downloads are determined using Fc⊥ equal to: 560 psi for glulam sizes and CC86, CC88
 and CC106; 750 psi for 7½" size; 625 psi for all others; reduce where end grain bearing
 or buckling capacity of the column, or other criteria are limiting.
- 4. Uplift loads have been increased for wind or earthquake load durations with no further increase allowed; reduce where other load durations govern. Uplift loads are limited by the beam shear capacity per 2005 NDS except CC76, CC78, and CC96 through CC106.
- 5. Beam splices with CC's must be detailed by the Designer to transfer tension loads between spliced members by means other than the column cap.
- 6. CC uplift loads do not apply to splice conditions.
- 7. Beam depth must be at least as tall as H₁.
- Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details).
- values on the narrow face (edge) (see page 191 for details). 9. For 54" engineered lumber, use CC 6X or ECC 6X models.

ECCLQ/CCCQ/CCTQ Column Caps

SIMPSON
Strong-Tie

The ECCLQ, CCCQ and CCTQ column caps provide high capacity, multiple beam to column connector options. The design uses Simpson Strong-Tie® Strong-Drive® screws (SDS) to provide faster installation and a lower profile compared to standard through bolts. Screws are con-figured to provide high uplift design values.

MATERIAL: 7 gauge

FINISH: Simpson Strong-Tie® gray paint, also available in HDG

INSTALLATION:

- Install Simpson Strong-Tie SDS ¼"x2½" wood screws, which are provided, in all round holes. (Lag screws will not achieve the same load.)
- No additional welding is allowed.

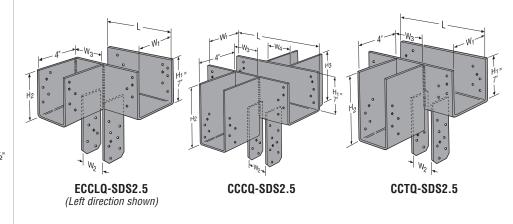

OPTIONS:

- Many combinations of beam and post sizes can be manufactured (refer to worksheet T-CCQLTC-WS).
- Available in widths up to 8" wide.
- ECCLQ is available in left or right side beam orientations.
 Specify ECCLLQ or ECCLRQ.
- Straps may be rotated where W₁ > W₂.
- Column caps may be ordered without the column straps for field welding to a column. No loads apply. Specify CCCOQ/CCTOQ/ECCLOQ.

ORDERING:

- The L dimension varies depending on the width of the side stirrup (W₃ or W₄). Contact Simpson Strong-Tie for exact dimensions.
- Main beam stirrup height (H₁) is 7". Side beam stirrups (H₂ or H₃) can vary in height with the minimum height of 7". Specify the side stirrup height from the top of the cap.
- Example Order: 4x Main Beam, 6x Post, 4x Side Beam (oriented to the left) is ordered as an ECCLLQ464SDS

CODES: See page 12 for Code Reference Key Chart.

		Allowabl	e Loads		
Series		Uplift (160)		Download	Code Ref.
	Main Beam	Side Beam	Total ²	(100/115/125)	11011
ECCLQ-SDS2.5	2835	2835³	3795		
CCCQ-SDS2.5	4780	2390¹	4780	Refer to note #4	170
CCTQ-SDS2.5	4910	2350	5315	11010 # 1	

- 1. Allowable load is per seat. Side beams must be loaded symmetrically for the CCCQ.
- The combined uplift loads applied to all beams in the connector must not exceed the total allowable uplift load listed in the table.
- 3. Where noted, the ECCLQ side beam may deflect an additional 1/8" beyond the standard 1/8" limit at the maximum uplift.
- 4. The combined download for all of the carried beams shall not exceed the allowable download for the unmodified product on page 54 (CCQ load for CCCQ and CCTQ, or ECCQ load for ECCLQ). The download for each side beam shall not exceed the lesser of 35% of the allowable download or 9265 lbs. for the unmodified product.
- 5. Column width in the direction of the beam width must be the same as the main beam width (W_1) .

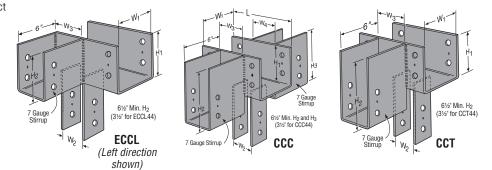

ECCL/CCC/CCT Column Caps

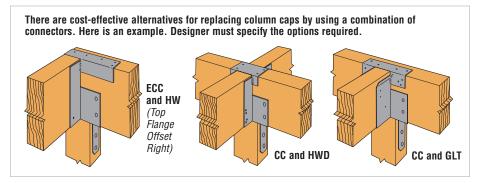

Column to beam connections often have multiple beams framing on top of a column. L, T, and Cross column caps provide design solutions for this application. Many combinations of beam and post sizes can be manufactured (refer to worksheet T-CCLTC-WS for details) with the following criteria applied:

- The download capacity shall be determined from the capacity for the unmodified product (see page 55). The side beam can take a maximum of 40% of the download and shall not exceed 10,665 lbs. The sum of the loads for the side beam(s) and main beam can not exceed the table load.
- Uplift loads do not apply for ECCL caps.
 For CCC and CCT, uplift loads from table apply for main beam only.
- The column width in the direction of the main beam width must be the same as the main beam width (W₁).
- Specify the stirrup height from the top of the cap. The minimum side stirrup heights (H₂ or H₃) is 6½" (3½" for 44's).
- The L dimension may vary depending on the width of the side stirrup (W₃ or W₄).
- Column caps may be ordered without the column straps for field welding to a column.
 No loads apply. Specify CCOC/CCOT/ECCOL.

Ordering Examples:

- A CCC66 with W₃ = 5½", H₂ and H₃ = 6½" is a CC66 column cap with 5½" beams on each side with all beam seats flush.
- An ECCLR66 with W₃ = 356", H₂ = 7½" is an ECC66 end column cap with a 4x beam on the right side (specify direction left (which is shown) or right for stirrup) and stirrup seat 1" below the cap seat.

STRONG FRAME[™] Ordinary Moment Frame

The Strong Frame Ordinary Moment Frame Catalog

All of the information you need on our latest lateral force-resisting solution is contained in the *Strong Frame Ordinary Moment Frame* catalog. Frame and anchorage design information, installation instructions, prescriptive wall bracing requirements and installation details are all included in this useful tool. Visit *www.strongtie.com* to download or request a copy or call (800) 999-5099.

For years moment frames have been a common method of providing high lateral-force resistance when limited wall space and large openings control the structural design. Traditionally, the disadvantage with moment frames has been that they are time-intensive to design and labor-intensive to install. Simpson Strong-Tie has taken these factors into consideration and has created a cost-effective alternative to traditional frames – the Strong Frame ordinary moment frame.

FEATURES:

- Pre-designed moment frame solutions: Designers can choose from 196 engineered frames, in sizes up to 16 feet wide and 19 feet tall, rather than having to spend hours designing one.
- 100% bolted connections: Install frames faster with no field welding required. No need to have a welder on site, or a welding inspector.
- Pre-installed wood nailers: Eliminate the need to drill and bolt nailers in the field.
- Frames fit in a standard 2x6 wall: No thicker walls additional framing or furring required.
- Greater quality control: Frames are manufactured in a quality-controlled environment and field-bolted connections eliminate questions about field welds.
- Convenient to store, ship and handle: Disassembled frames are more compact, minimizing deliveries and simplifying handling on the jobsite.
- Pre-assembled anchor-bolt assemblies: Anchor bolts are pre-assembled on a shear-lug
 plate that mounts on the form. This helps ensures correct anchor placement and creates
 more efficient anchor performance.
- Streamlined anchorage design: No more tedious anchorage calculations select an anchorage solution for your footing geometry from the anchorage tables and you are done.
- Post-installed anchorage solutions available for prescriptive applications: Simpson Strong-Tie® epoxy anchor solutions for higher load applications and solutions with the Simpson Strong-Tie Titen HD® screw anchor for prescriptive or lower-load applications.

Strong Frame OMFSL anchorage assemblies make design and installation faster and easier

STRONG-WALL® SHEARWALLS

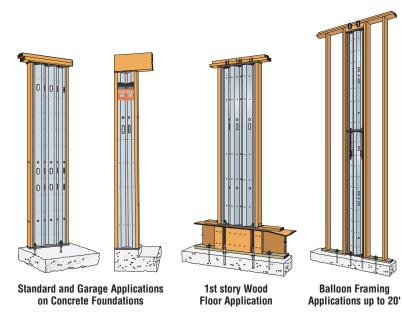

The Strong-Wall Shearwalls Catalog

The Simpson Strong-Tie® Strong-Wall Shearwalls catalog (C-SW) is the tool you need when specifying, installing or inspecting prefabricated shearwalls. This guide contains complete technical and installation information for our extensive line of steel and wood walls as well prescriptive wall bracing requirements. Complete installation details are also included to aid in correct specification and installation. Visit www.strongtie.com to download or request a copy or call (800) 999-5099.

STEEL STRONG-WALL® PANEL

The shearwall that combines superior performance with the easiest and fastest installation now offers new applications with simpler and better solutions for maximum design flexibility.

Two Story Stacked-Wall Applications

U.S. Patent Pending

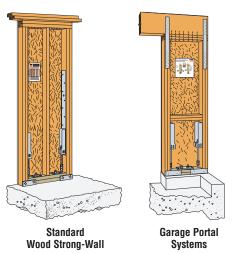

Cold-Formed Steel Applications

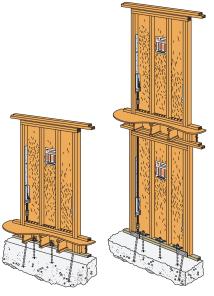

Complete Anchorage Solutions

WOOD STRONG-WALL® PANEL

Ideal for applications around window and door openings, garage wing walls, interior walls or any other locations where additional lateral resistance is required.

U.S. Patent 6,643,986 and 6,453,634

Raised Floor Walls for 1st and **2nd Story Applications**

The Anchor Tiedown System (ATS) Catalog

The Simpson Strong-Tie® Anchor Tiedown System for Multi-Story Overturning Restraint catalog (C-ATS) puts all the product and design information right at your fingertips, including technical information, multi-story rod system design concepts and schematics for runs up to five stories. Visit **www.strongtie.com** to download or request a copy or call (800) 999-5099.

The new Coupling Take-Up Device utilizes fewer parts, thereby streamlining installation and reducing labor costs

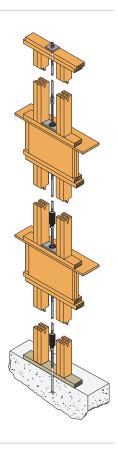

The ATS reduces installation time without sacrificing performance:

- Higher load capacities address more applications.
- The patent-pending Coupling Take-Up Device (CTUD) streamlines installation, eliminating up to 60–70% of labor costs when compared to other systems.
- Color-coded and stamped parts make it easy to match system components.

THE ATS SOLUTION

The Simpson Strong-Tie® Anchor Tie-down System (ATS) is designed to anchor stacked shearwalls in multi-story wood frame buildings while compensating for construction shrinkage and settling within the structure. The system resists overturning forces through bearing plates and Simpson Strong-Rod $^{\rm M}$ – connecting rods specifically designed for the ATS system. It is a high capacity restraint (50,000 lbs. plus) which exceeds bolted connections.

The Strong-Rods within the system are joined together by the new Coupling Take-Up Device (CTUD). The CTUD is a spring driven rod coupling device which contracts to compensate for rod movement caused by construction shrinkage and settling of the structure. This helps ensure that no gaps develop in the system that could compromise performance. The simplicity of the CTUD also greatly simplifies installation, reducing labor costs over alternative systems.

Simpson Strong-Tie® ATS Selector Software – Design Made Easier

The new ATS Selector software has been created with enhanced design versatility. The program allows engineers and architects to easily create a standard system design or customize the system to meet the specific needs of a project.

Easy to Use

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

The easy-to-use input screens make it simple to enter all the pertinent job details such as the project name and address as well as requirements such as number of stories (up to 6), applicable building code, and demand loads.

Customizable Solutions That Save Time

Based upon user inputs, the software recommends an ATS run to meet the requirements of your project. You can generate and save multiple runs and the program compiles a complete ATS materials list as well as a compression member lumber list.

Output the Way You Like It

Once results are saved, they can be sent electronically, exported into AutoCAD to generate drawings, and used to create a job summary which includes run configurations, calculations and an ATS material and lumber list.

Visit *www.strongtie.com* to download a free copy of the software or call 800-999-5099 to request a CD-ROM.

FACE MOUNT HANGERS LUC/LU/U/HU/HUC Standard Joist Hangers

SIMPSON Strong-Tie

LUCZ concealed flange hanger available for 2x6, 2x8, 2x10 and 2x12 lumber. Ideal for end of ledger/ header or post conditions, the LUCZ also provides cleaner lines for exposed conditions such as overhead decks.

See Hanger tables on pages 62 to 68. See Hanger Options on pages 181-183 for hanger modifications, which may result in reduced loads.

LU—Value engineered for strength and economy. Precision-formed—engineered for installation ease and design value.

U—The standard U hanger provides flexibility of joist to header installation. Versatile fastener selection with tested allowable loads.

HU/HUC—Most models have triangle and round holes. To achieve maximum loads, fill both round and triangle holes with common nails. These heavy-duty connectors are designed for schools and other structures requiring additional strength, longevity and safety factors.

MATERIAL: See tables on pages 62 to 68.

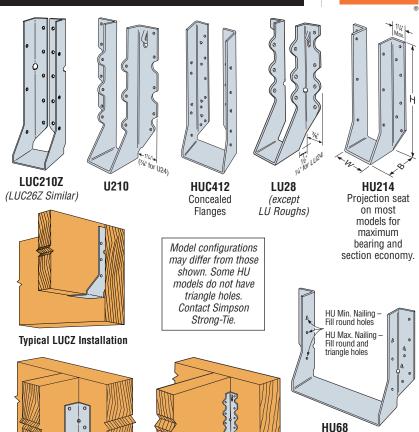

FINISH: Galvanized. Some products available in ZMAX® coating.

INSTALLATION:

- Use all specified fasteners. See General Notes.
- HU/HUC—can be installed filling round holes only, or filling round and triangle holes for maximum values.
- Joists sloped up to 1/4:12 achieve table loads.
- For installations to masonry or concrete see page 140.
- HU/HUC hangers can be welded to a steel member. Allowable loads are the lesser of the values in the Hanger tables on pages 62-68 or the weld capacity – refer to technical bulletin T-HUHUC-W (see page 191 for details).

OPTIONS: • HU hangers available with the header flanges turned in for 25/16" width and larger, with no load reduction—order HUC hanger.

- See Hanger Options on pages 181-183 for sloped and/or skewed U/HU models, and HUC (concealed flange) models.
- HU only—rough beam sizes available by special order.
- See page 68 for stocked U hanger rough sizes tables.
- · Also see LUS and HUS series.

HUCQ Heavy Duty Joist Hangers

The HUCQ series are heavy duty joist hangers that incorporate Simpson Strong-Tie® Strong-Drive® wood screws (SDS). Designed and tested for installation at the end of a beam or on a post, they provide a strong connection with fewer fasteners than nailed hangers. See page 83 for structural composite lumber hangers.

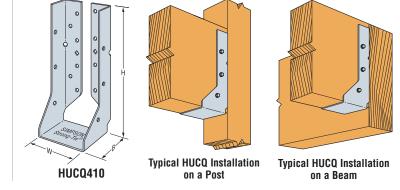

MATERIAL: 14 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- Install Simpson Strong-Tie SDS 1/4" x21/2" wood screws, which are provided, in all round holes. (Lag screws will not achieve the same load.)
- For use on solid sawn wood members.

OPTIONS: • These hangers cannot be modified.

CODES: See page 12 for Code Reference Key Chart.

Typical LU28 Installation

Typical HU Installation

Uplift loads have been increased 60% for wind or earthquake loading, with no further increase allowed.

² See page 83 for additional engineered wood products sizes.

^{3.} Structural composite lumber columns have sides that show either the wide face or the edges of the lumber strands/veneers. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) (see page 191 for details).

LUS/HUS Double Shear Joist Hangers

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

See Hanger tables on pages 62 to 68. See Hanger Options on pages 181-183 for hanger modifications, which may result in reduced loads.

All hangers in this series have double shear nailing. This innovation distributes the load through two points on each joist nail for greater strength. It also allows the use of fewer nails, faster installation, and the use of standard nails for all connections. (Do not bend or remove tabs.)

MATERIAL: See tables, pages 62 to 68.

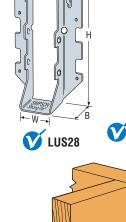

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION • Use all specified fasteners. See General Notes.

- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- Not designed for welded or nailer applications.
- 16d sinkers (0.148" dia. x 3½" long) may be used where 10d commons are specified with no reduction in load. Where 16d commons are specified, 10d commons or 16d sinkers (0.148" dia. x 3½" long) may be used at 0.85 of the table load.
- With 3x carrying members, use 16dx2½" nails into the header and 16d commons into the joist with no load reduction.
- With 2x carrying members, use 10dx1½" nails into the header and 10d commons into the joist, reduce the load to 0.64 of the table value.
- Use stainless-steel (SS) nails with stainless-steel (SS) hangers.

OPTIONS: • LUS hangers cannot be modified.

- HUS hangers available with the header flanges turned in for 2-2x (31/6") and 4x only, with no load reduction. See the HUSC Concealed Flange illustration.
- See Hanger Options, pages 181-183.

LOAD TABLE EXPLANATION

This icon identifies products that are available with additional corrosion protection. See pages 10-11 for additional information.

Dimensions W, H, B: This shows the product dimensions (width, height and base in this case.) referenced in the product drawing.

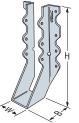

CATALOG DEFINITION:

Deflection: The distance a point moves when a load is applied.

NAILS: 16d = 0.162" dia. x $3\frac{1}{2}$ " long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

Throughout this catalog a footnote will typically be provided indicating the required nail diameter and length.

All installations should be designed only in accordance with the allowable load values set forth in this catalog.

Product Drawing: Provides a graphic presentation of the product with dimensional information (often cross referenced to the table).

^{1. 10}d commons or 16d sinkers may be used instead of the specified

¹⁶d at 0.84 of the table load value.

2. 16d sinkers may be used instead of the specified 10d commons with no load reduction. (16d sinkers are not acceptable for HDG applications.)

3. Uplift loads apply to 10d and 16d header fasteners. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector" software or conservatively divide the uplift load by 1.6.

^{4.} MIN nailing quantity and load values—fill all round holes; MAX nailing quantity and load values—fill all round and triangle holes.

5. DF/SP loads can be used for SCL that has fastener holding capacity of Doug Fir.

6. Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).

7. NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

^{*}Hangers do not have an Installed Cost Index.

SIMPSON

Strong-Tie

FACE MOUNT HANGERS – SOLID SAWN LUMBER (SPF/HF)

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

^{1. 10}d commons or 16d sinkers may be used instead of the specified 16d at 0.84 of the table load value.

2. 16d sinkers may be used instead of the specified 10d commons with no load reduction. (16d sinkers are not acceptable for HDG applications.)

3. Uplift loads apply to 10d and 16d header fasteners. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector software or conservatively divide the uplift load by 1.6.

4. MIN nailing quantity and load values—fill all round holes;
MAX nailing quantity and load values—fill all round and triangle holes.

5. Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).

6. NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

- 1. 10d commons or 16d sinkers may be used instead of the specified 16d at 0.84 of the table load value.
- 2. 16d sinkers may be used instead of the specified 10d commons with no load reduction.
- 3. Uplift loads apply to 10d and 16d header fasteners. Uplift loads $\,$ have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6.
- 4. DF/SP loads can be used for SCL that has fastener holding capacity of Doug Fir.
- 5. HU's can be ordered in rough sizes at full table loads. Add "X" to the model designation ex: HU28X and specify rough width or height. Maximum width 8".
- 6. **NAILS:** 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

CODES: See page 12 for Code Reference Key Chart.

Solid Sawn Lumber Connectors

TOP FLANGE HANGERS JB/LB/BA/B/HHB Joist, Beam and Purlin Hangers

SIMPSON Strong-Tie

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The BA hanger is a cost effective hanger featuring min/max joist nailing option. Min Nailing featuring Positive Angle Nailing targets moderate load conditions whereas the Max Nailing generates capacities for higher loads. The unique two level embossment provides added stiffness to the top flange.

The newly improved B hanger offers wide versatility with enhanced

See tables on pages 71 to 73. See Hanger Options on pages 181-183 for hanger modifications, which may result in reduced loads.

MATERIAL: See tables, pages 71 to 73.

FINISH: BA, JB, LB and B—Galvanized; HHB–all saddle hangers and all welded sloped and special hangers—Simpson Strong-Tie® gray paint. BA, LB, B and HHB may be ordered hot-dip galvanized, specify HDG.

INSTALLATION: • Use specified fasteners. See General Notes and nailer table.

- LB, BA, B and HHB may be welded to steel headers with weld size to match material thickness (approximate thickness shown). The minimum required weld to the top flanges is 1/8" x 2" (1/8" x 11/2" for LB) fillet weld to each side of each top flange tab for 14 and 12 gauge and %16" x 2" fillet weld to each side of each top flange tab for 7 gauge. Distribute the weld equally on both top flanges. Welding cancels the top and face nailing requirements. Consult the code for special considerations when welding galvanized steel. The area should be well-ventilated (see page 14 for welding information). Weld on applications produce the maximum allowable down load listed. For uplift loads refer to technical bulletin T-WELDUPLFT.
- · Ledgers must be evaluated for each application separately. Check TF dimension, nail length and nail location on ledger.
- Refer to technical bulletin T-SLOPEJST for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes (≤¾:12).

OPTIONS: • B and HHB

- Other widths are available; specify W dimension (the minimum W dimension is 1% for B and 3¼ for HHB).
 See Hanger Options, pages 181-183. BA, JB and LB hangers cannot
- be modified. Use LBV as an alternative for the JB/LB.

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector software or conservatively divide the uplift load by 1.6. For SPF use 0.86 x DF/SP uplift load.

 3. Code values are based on DF/SP header species.

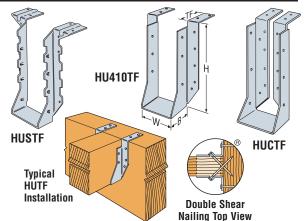

Where noted for single-ply joist hangers use 6-10dx1½" nails. NAILS: 16d = 0.162" dia. x $3\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

HUTF/HUSTF Heavy Duty and Double Shear Joist Hangers

See dimensions, material, loads on table pages. HUSTF has the double shear nailing advantage— distributing the joist load through two points on each nail for greater strength.

FINISH: Galvanized. See Corrosion Information, page 10-11. INSTALLATION:

- · Use all specified fasteners. See General Notes.
- Not acceptable for nailer or welded applications; see W and B hangers.
- . HUTF-The minimum header or ledger size that can be used with this hanger is 31/2".
- HUSTF-With 3x carrying members, use 16dx21/2" nails into the header and 16d commons into the joist. OPTIONS
 - · HUTF Rough beam sizes are available by special order.
 - · See Hanger Options on pages 181-183 for skewed
 - Available with flanges turned in (2-2x and 4x only for HUSCTF. 29/16" or greater for HUCTF).

Some model configurations may differ from those shown. Production models have projected seats. Square cut seats may be ordered. Contact Simpson Strong-Tie for details.

Nailer application is NOT acceptable. Fasteners

cannot be installed

TOP FLANGE HANGERS W/WPU/WNP/WM/WMU/HW/HWU/GLT/HGLT

SIMPSON Strong-Ti

The W, WPU, HWU and HW series purlin hangers offer the greatest design flexibility and versatility. WMs are designed for use on standard 8" grouted masonry block wall construction.

MATERIAL: See tables on pages 71 to 73.

FINISH: Simpson Strong-Tie® gray paint; hot-dip galvanized available: specify HDG, contact Simpson Strong-Tie.

INSTALLATION: • Use all specified fasteners. WM—two 16d duplex nails must be installed into the top flange and embedded into the grouted wall. Verify that the grouted wall can take the required fasteners specified in the table.

- · H dimensions are sized to account for normal joist shrinkage. W dimensions are for dressed timber widths.
- Hangers may be welded to steel headers with weld size to match material thickness (approximate thickness shown) 1/8" for W, 3/16" for WNP/WPU and 1/4" for HW/HWU, by 11/2" fillet welds located at each end of the top flange (see page 14 for welding information). Weld-on applications produce maximum allowable load listed. For
- uplift loads refer to T-WELDUPLFT (HWU and WPU hangers only).

 Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.
- Embed WM into block with a minimum of one course above and one course below the top flange with one #5 vertical rebar minimum 24" long in each cell. Minimum grout strength is 2000 psi.
- Refer to technical bulletin T-SLOPEJST for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes (≤¾:12).
- · See Hanger Options, page 181-183 for hanger modifications and associated load reductions.

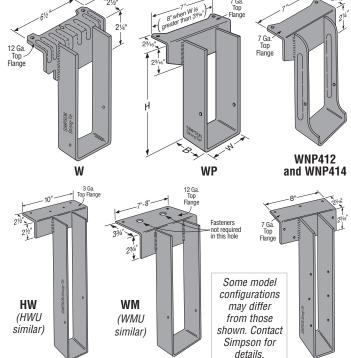

CODES: See page 12 for Code Reference Key Chart.

NAILER TABLE

The table indicates the maximum allowable loads for W. WNP and HW hangers used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

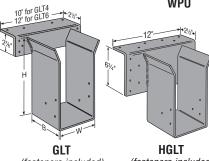

- 1. Uplift value for the HWU hanger is for depths ≤ 18" and are for DF/SP values only. Refer to uplift values in table below for taller depths.
- 2. Attachment of nailer to supporting member is the responsibility of the Designer.

Refer to page 139 for Top of Wall Installation Detail

(fasteners included) (fasteners included) See page 114 for GLT and HGLT information.

WPU

Installation on Wood Nailer

- 1. 16d sinkers (0.148" dia. x 31/4" long) may be used where 10d commons are called out with no load reduction. 2. Code values are based on
- DF/SP header species.
 3. WMU, WPU and HWU uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6.
- 4. For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.
- 5. Mid-wall Installation requires minimum of one grouted course above and below the hanger.

 6. NAILS: 16d = 0.162" dia. x 3½"
- long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

^{1.} N54A fasteners are supplied with hangers.

CODES: See page 12 for Code Reference Key Chart.

 ^{1.6}d sinkers may be used where 10d commons are called out with no load reduction.
 Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™software or conservatively divide the uplift load by 1.6. For SPF use 0.86 x DF/SP uplift load.

^{4.} NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

^{*}Hangers do not have an Installed Cost Index.

LSU/LSSU Adjustable Light Slopeable/Skewable U Hangers

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The LSU and LSSU series of hangers may be sloped and skewed in the field, offering a versatile solution for attaching joists and rafters. These hangers may be sloped up or down and skewed left or right, up to 45°.

MATERIAL: See table

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

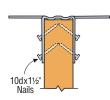

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Attach the sloped joist at both ends so that the horizontal force developed by the slope is fully supported by the supporting members.
- To see an installation video on this product, visit www.strongtie.com.

CODES: See page 12 for Code Reference Key Chart.

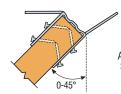

LSU and LSSU INSTALLATION SEQUENCE

(For Skewed or Sloped/Skewed Applications)

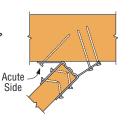

STEP 1 Nail hanger to slope-cut seat nail first. No bevel

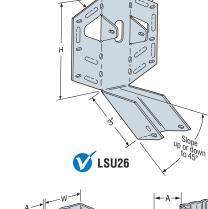

carried member, installing necessary for skewed installation. Install joist nails at 45° angle.

STEP 2 Skew flange from 0-45°. Bend other flange back along centerline of slots until it meets the header. Bend one time only.

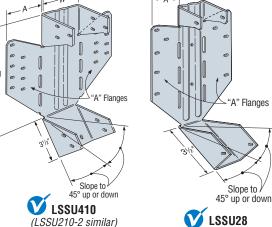

STEP 3 Attach hanger to the carrying member, acute angle side first (see footnote 4). Install nails at an angle

"A" Flange

"A" Flange

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Roof loads are 125% of floor loads unless limited by other criteria.
- 2. Uplift loads include a 60% increase for wind or earthquake loading with no further increase is allowed; reduce when other loads govern.
- 3. Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF (see page 191 for details) for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria.
- 4. For skewed LSSU hangers, the inner most face fasteners on the acute angle side are not installed.
- 5. 10dx1½" nails may not be used for face nails on skewed or sloped and skewed LSU and LSSU hangers.
- 6. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

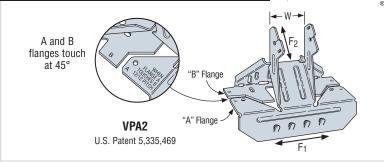

Strong-Tie

VPA Variable Pitch Connectors

The VPA may be sloped in the field, offering a versatile solution for attaching rafters to the top plate. It will adjust to accommodate slopes between 3:12 and 12:12, making it a complement to the versatile LSSU. This connector eliminates the need for notched rafters, beveled top plates and toe nailing.

MATERIAL: 18 gauge FINISH: Galvanized INSTALLATION:

· Use all specified fasteners. See General Notes. CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Loads may not be increased for short-term loading.

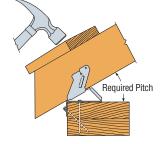

3. **NAILS:** 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

VPA INSTALLATION SEQUENCE

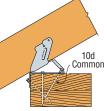

STEP 1

Install top nails and face PAN nails in "A" flange to outside wall top plate.

STEP 2

Seat rafter with a hammer, adjusting "B" flange to the required pitch.

STEP 3

Install "B" flange nails in the obround nail holes, locking the pitch.

STEP 4

Install 10dx11/2" nail into tab nail hole. Hammer nail in at a slight angle to prevent splitting.

HCP Hip Corner Plates

The HCP connects a rafter or joist to double top plates at a 45° angle.

MATERIAL: 18 gauge

FINISH: HCP2—galvanized or ZMAX® coating; HCP4Z—ZMAX coating INSTALLATION: • Use all specified fasteners. See General Notes.

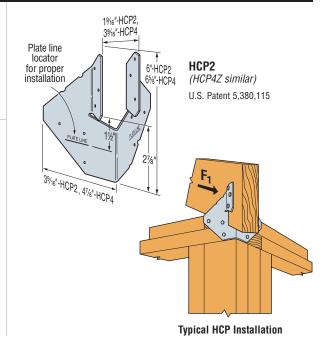

- Attach HCP to double top plates; birdsmouth not required for table loads.
- Install rafter and complete nailing. Rafter may be sloped to 45°.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Member Size	Model No.	Faste	eners	DF/ Allow Loa	able	SPF Allow Loa	able	Code Ref.

- 1. Loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. The HCP can be installed on the inside and the outside of the wall with a flat bottom chord truss and achieve twice the load capacity.
- 3. **NAILS:** 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

HRC Hip Ridge Connectors

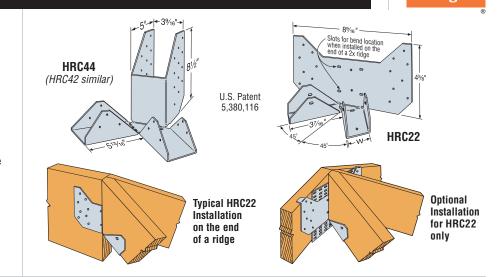

The HRC series are field slopeable connectors that attach hips to ridge members or trusses. The HRC may be sloped to 45° with no reduction in loads.

MATERIAL: HRC22, HRC42–16 gauge; HRC44–14 gauge

FINISH: Galvanized INSTALLATION:

- Use all specified fasteners.
 See General Notes.
- On end of ridge—use optional diamond holes on HRC22 and HRC42 to secure the HRC. Bend face flanges on HRC22 back flush with ridge, and complete nailing.
- HRC22 on face of ridge—adjust to correct height and install nails.
- Double bevel-cut hip members to achieve full bearing capacity.

CODES: See page 12 for Code Reference Key Chart.

Model	Mem	iber Size	Faste	eners		DF/SP Allov	vable Loads	3	S	PF/HF Allo	wable Load	s	Code

- 1. Allowable loads shown are for each hip. Total load carried by the connector is double this number.
- 2. Uplift loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

Nailing (Top View)

- 3. Roof loads are 125% of floor loads unless limited by other criteria.
- 4. NAILS: 16d = 0.162" dia. x 3½" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

PF Post Frame Hangers

PFD and PFA post frame hangers have double shear nailing to speed installation. Diamond holes allow easy hanger alignment and attachment.

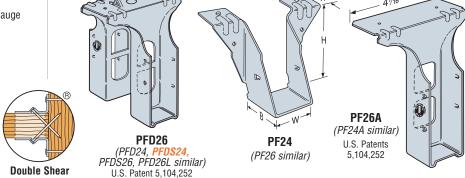

MATERIAL: PF24, PF26—18 gauge; all others 20 gauge

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners.
See General Notes.

- Diamond holes on PFD allow optional top flange nailing.
- Carried member nails must be driven at an angle through the joist into the header to achieve the table loads.

OPTIONS: These hangers cannot be modified.
CODES: See page 12 for Code Reference
Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. NAILS: 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

THA/THAC/THAR/L Adjustable Truss Hangers

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The THA series' extra long straps allow full code nailing and can be field-formed to give top flange hanger convenience.

Designed for 4x2 floor trusses and 4x beams, the THAR/L422 has a standard skew of 45°. Straps must be bent for top flange hanger installation. PAN nailing helps eliminate splitting of 4x2 truss bottom chords.

MATERIAL: See table

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

The following installation methods may be used:

• Top Flange Installation—The straps must be field formed over the header – see table for minimum top flange requirements. Install top and face nails according to the table. Top nails shall not be within 1/4" from the edge of the top flange members.

For the THA29, nails used for joist attachment must be driven at an angle so that they penetrate through the corner of the joist and into the header. For all other top flange installations, straighten the double shear nailing tabs and install the nails straight into the joist.

- Face Mount Installation—Install all face nails according to the table.

 Not all nail holes will be filled on all models. On models where there are more nail holes than required, the lowest 4 face holes must be filled. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.
- Alternate Installation— The THA 4x hangers may be installed in a top flange configuration using the tabulated fasteners for face mount installation and achieve the face mount installation loads. Install the tabulated face nails into the face and top of the carrying member. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.

OPTIONS: • THA hangers available with the header flanges turned in for 35%" (except THA413) and larger, with no load reduction – order THAC hanger. **CODES:** See page 12 for Code Reference Key Chart.

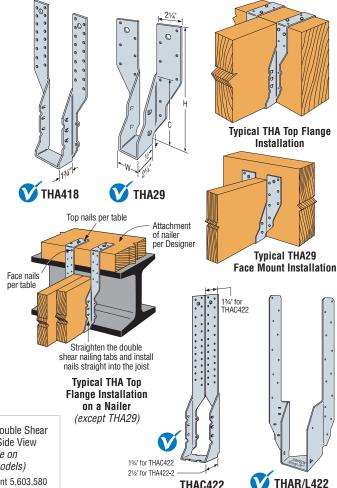

Double Shear Nailing Side View Do not bend tab unless otherwise noted

- 1. 16d sinkers may be used to replace 16d commons at 0.85 of table load.
- 2. Uplift has been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 3. Roof loads are 125% of floor loads unless limited by other criteria.
- 4. THAR/L422 with 4-10d top nails and 2-10d face nails: When the hanger height is between 9" to 12", the allowable download is 1440 lbs. for DFL and 1210 lbs. for SPF. No further increase allowed.
- 5. For top flange installation on a nailer (see detail above), install joist nails straight by bending the double shear tabs.
- 6. For single 2x nailers, the following THA hangers can be installed using 10dx11/2" top nails and 2-16d face nails with reduced allowable loads as noted: 1415 lbs. for THA418 and THA422, and 2255 lbs. for THA426.
- 7. Min. Top Flange refers to the minimum length of strap that must be field-formed over the header.
- 8. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long, $16dx2\frac{1}{2} = 0.162$ " dia. x $2\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

SUR/SUL/HSUR/HSUL Skewed 45° Hangers

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The SU and HSU series of hangers are skewed 45° left

or right. Angled nail slots direct nails for proper installation.

MATERIAL: SUR and SUL-16 gauge; HSUR and HSUL-14 gauge FINISH: Galvanized. Some products available in ZMAX® coating;

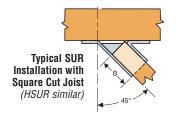

see Corrosion Information, page 10-11.

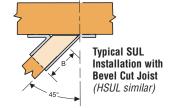

INSTALLATION: • Use all specified fasteners. See General Notes.

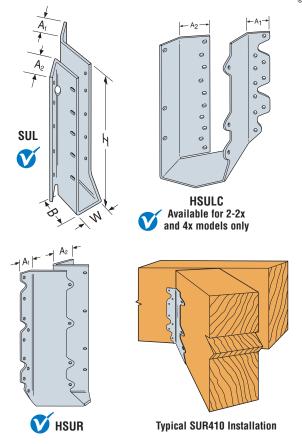

- These hangers will normally accommodate a 40° to 50° skew.
- · Illustration shows left and right skews SUR/L (SUR=skewed right; SUL=skewed left).
- The joist end may be square cut or bevel cut.
- For installations to concrete/masonry walls see page 140.

Solid Sawn Lumber Connectors

- Available with the A2 flange turned in on the 2-2x and 4x models only (see illustration).
- To order, add "C" (for concealed) to the product name.
- For example, specify HSURC46, HSULC46, SURC46, or SULC46.

- 1. Uplift loads have been increased by 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Roof loads are 125% of floor loads unless limited by other criteria.
- 3. Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).
- 4. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long, $16dx2\frac{1}{2} = 0.162$ " dia. x $2\frac{1}{2}$ " long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

HFN/F Panelized Construction Hangers

The HF24N, HF26N, HF34N and HF36N hangers are designed for panels or components using jigs or similar devices for precision fabrication. Grip-groove feature provides positive lock into the 2x or 3x member without nailing. F series panel hangers are engineered components for panelized construction only.

MATERIAL: 18 gauge

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

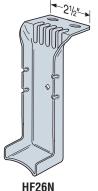

INSTALLATION:

- Use all specified fasteners. See General Notes.
- In panelized construction, it is acceptable to nail through the sheathing into the hanger's top flange using one 10dx2½" nail placed in the middle third of the top flange, no closer than ½" from the back edge of the hanger. See technical bulletin T-HFHANGER for additional information (see page 191 for details).
- On the F-series hanger, the seat nail is non-structural and does not contribute to the load.
- For additional information on retrofit options see flier F-RUZNRUZ (see page 191 for details).

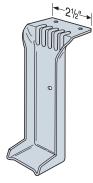

CODES: See page 12 for Code Reference Key Chart.

HF24N (*HF34N similar*) U.S. Patent 6,260,402

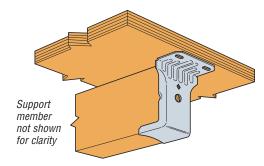

HF26N (HF36N similar) Dimples hold joist securely in place U.S. Patent 6,260,402

F26P

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Typical HF24N Installation (HF34N similar)

1.10d common nails can be used for specified 10dx2½ nails. 2.NAILS: 10d = 0.148" dia. x 3" long, 10dx2½ = 0.148" dia. x 2½" long.

See page 16-17 for other nail sizes and information.

Typical Hybrid Panelized Roof System

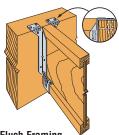

Typical Wood Framed Panelized Roof System

GENERAL CONNECTOR INSTALLATION

SIMPSON Strong-Tie

TOP FLANGE HANGERS

Flush Framing

Engineered Wood & Structural Composite Lumber Connectors

Top flange configuration and thickness of top flange need to be considered for flush frame conditions.

Hanger Over-Spread

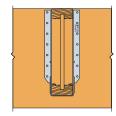

If the hanger is over-spread, it can raise the I-joist above the header and may cause uneven surfaces and squeaky floors.

Hanger Not Plumb

A hanger "kicked-out" from the header can cause uneven surfaces and squeaky floors.

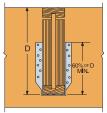

PREVENT ROTATION

Hangers provide some joist rotation resistance; however, additional lateral restraint may be required for deep joists.

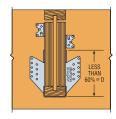

No Web Stiffener Installed

Hanger side flange supports joist top flange.

Web Stiffener Required

Hanger side flange should be at least 60% of joist depth or potential joist rotation must be addressed.

Rotation Resistance

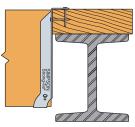

If non-skewed hanger side flange is less than 60% of joist depth, attach staggered A34 framing anchors above the hanger.

No Web Stiffener Results in Rotation

Hanger side flange is below the joist top flange. No web stiffener results in rotation, unless restrained by other means.

WOOD NAILERS

Correct Attachment

Nailer Too Wide

The loading may cause cross-grain bending. As a general rule, the maximum allowable overhang is 1/4", depending on nailer thickness.

Nailer Too Narrow

A maximum mismatch of 1/8" for normal installations is allowed.

Nailer Too Thin or the wrong hanger for the application.

TOE-NAILING

Toe nailing causes squeaks and improper hanger installations. Do not toe nail I-joists before installing top flange or face mount hangers.

WOOD I-JOISTS

SLOPED JOISTS

For sloped joists up to 1/4:12 there is no reduction. For slopes greater than 1/4:12 see individual product pages or refer to technical bulletin T-SLOPEJST (see page 191 for details).

MULTIPLE JOISTS

Multiple joists should be adequately connected together to act as one unit.

FASTENERS

Use the correct nails. Wood may split if the nails are too large. Hanger nails into flanges should not exceed 10d common (0.148 dia.), no longer than 1½". Nails into web stiffeners should not exceed 16d commons (0.162 dia.)

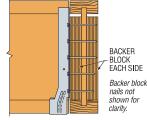

ECCENTRICALLY-LOADED I-JOISTS

Supporting a top flange hanger may require bottom flange restraining straps, blocking or directly-applied ceiling systems to prevent rotation at the hanger location.

SKEWED JOISTS

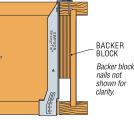

Joists may be skewed up to 2½ degrees in a non-skewed hanger without any load reduction. Refer to individual hanger descriptions for information allowing any further skew applications.

I-JOIST AS A HEADER INSTALLATIONS

Face Mount Hanger

When face mount hangers are attached to I-joist headers. backer blocks must be installed to provide a nailing surface for the hanger nails. The backer blocks should be installed on both sides of the web and attached together with a minimum of 10-10d nails. The hanger nails should extend through the web. Contact the I-Joist manufacturer for additional design considerations.

Top Flange Hanger

When top flange hangers are attached to I-joist headers, a backer block must be installed to prevent the top flange from rotating under load. The backer blocks should be installed with a minimum of 10-10d nails clinched. Check with the joist manufacturer for additional design considerations.

POSITIVE ANGLE NAILING

Correct Nailing Approx. 45° angle

Nail too long

Nail at wrong angle

STRONG-DRIVE® SCREW INSTALLATION FOR LVL, PSL and LSL

SDS 1/4"x6"

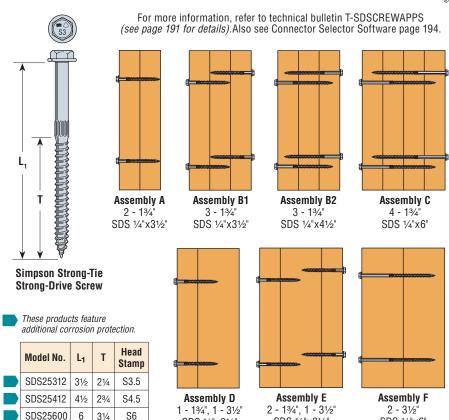

Simpson Strong-Tie® Strong-Drive screws (SDS) are an easy to install method for joining multiple SCL members to make a beam.

INSTALLATION:

- . No pre-drilling required.
- See illustrations for SDS positioning on different assemblies.
- · SDS screws install best with a low speed ½" drill with a %" hex head driver.
- . Do not over-drive the SDS screws.

DESIGN:

- · SDS allowable load values are from ICC ESR-2236. The Designer shall apply adjustment factors per the NDS. Loads shown are $C_D = 1.0$. Increase as allowed per code to a maximum $C_D = 1.60$.
- · This document uses Douglas Fir-Larch values (G = 0.5), as per the LVL. PSL and LSL manufacturer's instructions.
- . The Designer shall specify the location of all screws (stagger screws on opposite faces). Minimum recommended spacing—Wide Face: end distance 4", edge distance 11/2", spacing parallel to grain 4", spacing perpendicular to grain 2".
- · Uniform loads in the table below are based on the capacity of the fasteners to transfer loads between plies. The capacity of the LVL beam may be less and should be checked by a qualified Designer or with the manufacturer's literature.
- LSL applications that require 4½" and 6" screws (Assembly B2, C and F) are limited to interior-dry use only.

SDS 1/4"x31/2"

SDS 1/4"x31/2"

		MAXIMUM AL	LOWABLE UNIFORM	LOAD (LBS PER LIN	EAL FT)		
	Multiple Members	SDS Screv	ws, 12" OC	SDS Screv	ws, 16" OC	SDS Screv	ws, 24" OC
Assembly	Components	2 Rows	3 Rows	2 Rows	3 Rows	2 Rows	3 Rows
А	2 pieces (all 1¾)	1360	2040	1020	1530	680	1020
B1	3 pieces (all 1¾)	1020	1530	765	1150	510	765
B2 ⁴	3 pieces (all 1¾)	1290	1935	970	1450	645	970
C4	4 pieces (all 1¾)	1110	1665	835	1250	555	835
D	2 pieces (1¾ - 3½)	1020	1530	765	1150	510	765
E	3 pieces (1¾ - 3½ - 1¾)	905	1360	680	1020	455	680
F ⁴	2 pieces (3½ - 3½)	1360	2040	1020	1530	680	1020

- 1. If 7" wide beams are not equally loaded on each side, the plf load from the lesser side should be at least 25% of the opposite side.
- 2. Quantity and spacing of screws in table are for each screw head side of the assembly as shown in the Assembly figures above.
- 3. The design professional shall ensure that adequate lateral bracing is provided to prevent displacement of the beam due to the torsion created by the structural members framing into the side of the beam assembly.
- 4. LSL applications involving Assemblies B2, C and F are limited to interior-dry use only.

CSC Ceiling Support Clip /FSS Furring Stabilizer Strap

Provides 1" separation between the furring channel and joist to allow for the use of Thermafiber® insulation and the attachment of the furring channel to all joists. Provides an efficient sound barrier, and a one hour U.L. listed fire rating.

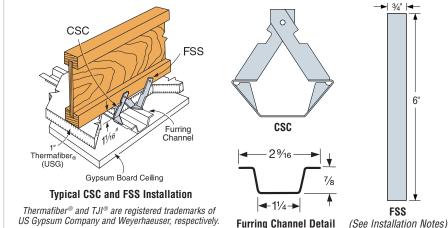

- UL Listed. See Underwriters Laboratory, Inc. Design No. L530 for USG gypsum board and Weyerhaeuser/TJI® joists.
- · Check ICC-ES reports for individual I-joist manufacturer approvals.

MATERIAL: 24 gauge (minimum)

FINISH: Galvanized

INSTALLATION: • For CSC use 1-8dx1½ nail.

 For FSS use #8 self-tapping steel screw (not provided) into channel, twist 90°, bend upward and fasten to the side of joist bottom flange with screw or nail

Furring Channel Detail

IUS/IUT/MIU 1-Joist Hangers

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The improved IUS is now fully compatible with shallow flange I-joists! I-joists with flange thicknesses between 11/8" and 11/2" achieve the full allowable table loads including uplift values and joist nails are not required! The IUS is a hybrid hanger that incorporates the advantages of the face mount and top mount hanger. Installation is fast with the Strong-Grip™ seat, easy-to-reach face nails and self-jigging locator tabs.

The MIU series hangers are designed for commercial and high load I-joist applications without requiring web stiffeners. The MIU features Positive Angle Nailing (PAN), which minimizes splitting of the flanges while permitting time-saving nailing from a better angle.

The IUT features a bend-tab which nails into the I-joist's bottom flange when web stiffeners are not used, or directly into the web stiffener. I-joist flange thickness for bend-tab application is 11/8" to 11/2". This constrains the member, helping to reduce squeaks resulting from joist movement.

Refer to Joist Manufacturer's literature or appropriate Simpson Strong-Tie® Connector Selection Guide for actual joist sizes.

MATERIAL: See table page 84-86. FINISH: Galvanized

UPLIFT LOADS: • Models have optional triangle joist nail holes for additional uplift. Properly attached web stiffeners are required.

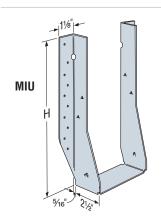

- IUT—add two additional 10dx11/2" joist nails for a total uplift load of 575 lbs.
- MIU—add four additional 10dx1½" joist nails for a total uplift load
- IUS—add web fillers and two 10dx1½" joist nails in the triangle holes for a total uplift of 355 lbs.

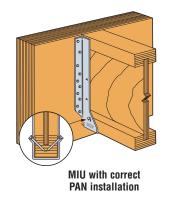

INSTALLATION: • Use all specified fasteners. Verify that the header can take the required fasteners specified in the table. See page 80 for more installation information.

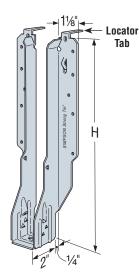

- IUS—fasten hanger to header. Position I-joist into hanger and snap into place. No joist nailing required. Some IUS models have triangle and round header nail holes. To achieve Max. download, fill both round and triangle holes.
- IUS-Locator tabs are not structural. They may be bent back to adjust for hanger placement.
- IUS—for rimboard applications see technical bulletin T-RIMBDHGR (see page 191 for details).
- IUS— I-joists with web stiffeners or rectangular sections can be used with the installation of 2-10dx11/2" nails into the optional triangle joist nails.
- IUT—optional seat diamond hole allows alternate attachment of hanger. Refer to technical bulletin T-OPTUPLIFT (see page 191 for details).
- Web stiffeners are not required with I-joists when the joist top flange is laterally supported by the sides of the hanger. I-joist manufacturers may require web stiffeners.

OPTIONS:

These hangers cannot be modified. However, these models will normally accommodate a skew of up to 5° For sloped joists up to 1/4:12 there is no reduction, between 1/4:12 and up to ½:12, tests show a 10% reduction in ultimate hanger strength. Local crushing of the bottom flange or excessive deflection may be limiting; check with joist manufacturer for specific limitations on bearing of this type.

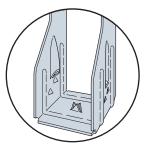

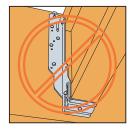

(Some IUS models have triangle holes in header flanges for Min/Max nailing)

U.S. Patent 6,523,321

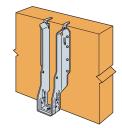

The Strong-Grip™ seat secures I-joists in position without joist nails

AVOID A MISINSTALLATION

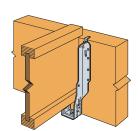

Do not make your own holes. Do not nail the bottom flange.

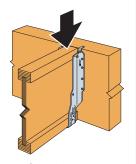

IUS INSTALLATION SEQUENCE

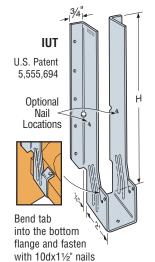

STEP 1 Attach the IUS to the header

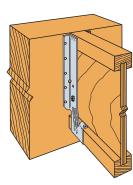

Slide the I-joist downward into the IUS until it rests above the large teardrop.

Firmly push or snap I-joist fully into the seat of the IUS.

at approximately 45°.

Typical IUT Installation

FACE MOUNT HANGERS U/HU/HUC/HUCQ 1-Joist & Structural Composite Lumber Hangers

See Hanger tables on pages 84 to 88. See Hanger Options on pages 181-183 for hanger modifications, which may result in reduced loads.

U—The standard U hanger provides flexibility of joist to header installation. Versatile fastener selection with tested allowable loads.

HU/HUC—Most models have triangle and round holes. To achieve maximum loads, fill both round and triangle holes with common nails. These heavy-duty connectors are designed for schools and other structures requiring additional strength, longevity and safety factors.

HUCQ—Features concealed flanges so it can be installed close to the end of the supporting beam or on a post. They install with Simpson Strong-Tie® Strong-Drive® screws (SDS) (supplied with the hanger) for high capacity and ease of installation.

MATERIAL: See tables on pages 84 to 88.

FINISH: Galvanized

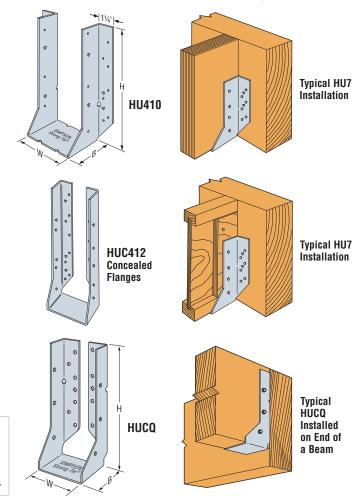

INSTALLATION: • Use all specified fasteners. See General Notes.

- HU/HUC—can be installed filling round holes only, or filling round and triangle holes for maximum values.
- HUCQ—When using structural composite lumber columns, the capacities shown in the tables are for fasteners applied to the wide face of the column. See technical bulletin T-SCLCOLUMN for more information (see page 191 for details).
- Web Stiffeners are required for all I-joists used with these hangers.
- For installation to masonry or concrete, see page 140.
- HU/HUC hangers can be welded to a steel member.
 Allowable loads are the lesser of the values in the Hanger tables on pages 84-88 or the weld capacity – refer to technical bulletin T-HUHUC-W (see page 191 for details).

OPTIONS: • HU hangers available with the header flanges turned in for 25/16" and larger widths, with no load reduction—order HUC hanger.

- See Hanger Options on pages 181-183 for sloped and/or skewed U/HU models, and HUC (concealed flange) models.
- · See also HUS series.

Model configurations may differ from those shown. Some HU models do not have triangle holes. Contact Simpson Strong-Tie for details.

FACE MOUNT HANGERS HUS/HHUS/HGUS Double Shear SCL Hangers

See Hanger tables on pages 87-88. See Hanger Options on pages 180-181 for hanger modifications, which may result in reduced loads.

These hangers are designed for applications where higher loads are needed (also see HUC and HUCQ).

All hangers in this series have double shear nailing. This patented innovation distributes the load through two points on each joist nail for greater strength. It also allows the use of fewer nails, faster installation, and the use of common nails for all connections. (Do not bend or remove tabs)

MATERIAL: See tables, pages 87-88.

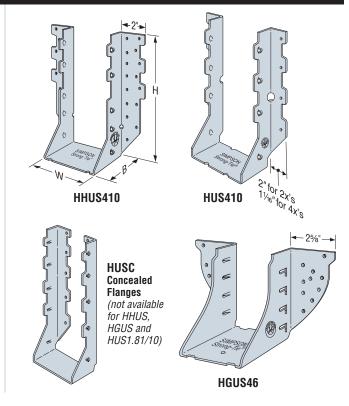

FINISH: Galvanized. Some products available in stainless steel or ZMAX®; see Corrosion Information, page 10-11.

INSTALLATION • Use all specified fasteners. See General Notes.

- · Do not use double shear hangers with I-joists.
- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- Not designed for welded or nailer applications.
- 16d sinkers (0.148" dia. x 3½" long) may be used where 10d commons are specified with no reduction in load. Where 16d commons are specified, 10d commons or 16d sinkers (0.148" dia. x 3½" long) may be used at 0.85 of the table load.
- With 3x carrying members, use 16dx2½" (Simpson Strong-Tie® N16) nails into the header and 16d commons into the joist with no load reduction. With 2x carrying members, use 10dx1½" nails into the header and 10d commons into the joist, and reduce the load to 0.64 of the table value.

OPTIONS: • HUS hangers available with the header flanges turned in for 3½" wide joist only, with no load reduction. See HUSC Concealed Flange illustration.

- Concealed flanges are not available for HGUS, HUS1.81/10 and HHUS.
- See Hanger Options, pages 181-183, for sloped and/or skewed HHUS and HGUS models.
- Other sizes available; contact Simpson Strong-Tie for details.

^{1.10}d commons or 16d sinkers may be used instead of the specified 16d at 0.84 of the table load value.

^{2.16}d sinkers may be used instead of the specified 10d commons with no load reduction.
3. Uplift loads based on DF/SP lumber and have been increased 60% for

wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™software or conservatively divide the uplift load by 1.6. For SPF/HF use 0.86 x DF/SP uplift load.
4.MIN nailing quantity and load values—fill all round holes;

MAX nailing quantity and load values—fill all round and triangle holes.

^{5.} Hangers sorted in order of recommended selection for best overall performance and installation value.

^{6.} Web stiffeners are required where noted in the table or when either the joist top flange isn't supported laterally by the hanger or when supporting double I-joists with flanges less than 15/16" thick.

^{7.} **NAILS:** 16d = 0.162" dia. $\times 3\frac{1}{2}$ " long, 10d = 0.148" dia. $\times 3$ " long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

^{1. 10}d commons or 16d sinkers may be used instead of the specified 16d at 0.84 of the table load value.

^{2. 16}d sinkers may be used instead of the specified 10d commons with no load reduction.

^{3.} Uplift loads based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6.

For SPF/HF, use 0.86 x DF/SP Uplift Load for products requiring nails and 0.72 x DF/SP Uplift Load for products requiring screws.

4. MIN nailing quantity and load values—fill all round holes; MAX nailing quantity and load values—fill all round and triangle holes.

5. Hangers sorted in order of recommended selection for best overall

performance and installation value.

6. NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

THAL I-Joist & Structural Composite Lumber Hangers

Designed for I-joists, the THAI has extra long straps and can be field-formed to give height adjustability and top flange hanger convenience. Positive angle nailing helps eliminate splitting of the I-joist's bottom flange.

MATERIAL: THAI-2–14 gauge; all others–18 gauge FINISH: Galvanized

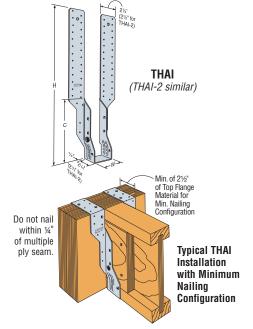

INSTALLATION: • Factory-order the THAI-2 for hanger width needed. See table for allowable widths.

- Use all specified fasteners. Verify that the header can take the fasteners specified in the table.
- · Web stiffeners are required for all I-joists used with these hangers.
- When a total of 20 face nails are used in THAI straps, or 30 face nails are used in THAI-2 straps, the maximum load-carrying capacity is achieved.
- · Reduce load given by allowable nail shear capacity for each nail less than maximum.
- A minimum nailing configuration is shown for top nailing installations. The strap must be field-formed over the top of the header by a minimum of 2½".

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie Connector® Selector™ software or conservatively divide the uplift load by 1.6. For SPF/HF use 0.86 x DF/SP uplift load.
 2. Roof loads are 125% of floor loads unless limited by other criteria.
- 3. The minimum header depth to achieve the maximum nail configuration is 16".
- For the THAI3522 supporting a 2¼" joist, the download shall be the lesser of the table load or 1400 lbs.
- 5. NAILS: 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information

LGU/MGU/HGU/HHGU High Capacity Girder Hangers

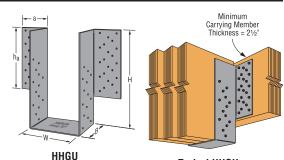

The GU hangers are a high-capacity girder hangers designed for situations where the header and joist are flush at top. This part can be used for retrofit on the framing members after they are temporarily placed in position. It uses Simpson Strong-Tie® Strong-Drive® screws (SDS) to make installation fast and easy, with no pre-drilling required.

MATERIAL: See table FINISH: Galvanized, HHGU—Simpson Strong-Tie® gray paint INSTALLATION: • Use all specified fasteners. See General Notes.

- Install with Simpson Strong-Tie SDS ¼"x2½" screws, which are provided with the GU's. (Note: lag screws will not achieve the same loads.)
- All multiple members must be fastened together to act as a single unit.
- Multiple member headers may require additional fasteners at the hanger locations.
 The quantity and location of the additional fasteners must be determined by the Designer.

OPTIONS: • Hot-dip galvanized available. Order as "X" version, specify HDG.

- Other seat widths available. Order as "X" version, specify width.
- See Hanger Options, pages 181-183, for one flange concealed option (all models except MGU3.63). **CODES:** See page 12 for Code Reference Key Chart.

^{1.} Uplift loads have been increased for earthquake and wind loading, with no further increase allowed.

^{2.} Specify H dimension. Maximum H = 30".

on a Steel Beam

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

A dedicated range of Top Flange I-joist hangers meeting the unique needs of I-joists while offering superior performance and ease of installation.

The innovative ITS sets a new standard for engineered wood top flange hangers. The ITS installs faster and uses fewer nails than any other EWP top flange hanger. The new Strong-Grip™ seat and Funnel Flange™ features allow standard joist installation without requiring joist nails resulting in the lowest installed cost. The Strong-Grip seat firmly secures I-joists with flange thicknesses from 11/8" to 11/2". The ITS design maintains superior allowable download capacities equal to or greater than the ITT for Douglas Fir and all SCL headers.

Engineered Wood & Structural Composite Lumber Connectors

The ITT's special bend-tabs constrains the I-joist, helping to reduce squeaks resulting from joist movement. I-joist flange thickness for bend-tab application is

MIT/HIT - Patented Positive Angle Nailing (PAN)

PAN is specifically designed for I-joists when used with the MIT or HIT. With PAN, the nail hole material is not removed, but is formed to channel and confine the path of the nail at approximately 45°. PAN minimizes splitting of the flanges while permitting time-saving nailing from a better angle. See Top Flange tables on pages 96 to 105.

Refer to Joist Manufacturer's literature or appropriate Simpson Strong-Tie® Connector Selection Guide for actual joist sizes.

MATERIAL: ITS, ITT-18 gauge; MIT, HIT-16 gauge

FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. Verify that the header can take the required fasteners specified in the table.

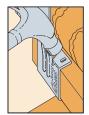

- See product specific installation drawings pages 90-91.
- ITS—no joist nailing required for standard I-joist installation without web stiffeners. When supporting I-joists with web stiffeners or rectangular SCL member 2-10dx1½" must be installed into optional triangle joist nail holes for standard installation values.
- ITS and ITT—optional triangle nail holes may be used for additional load. See allowable load tables. Refer to technical bulletin T-OPTUPLIFT for additional options (see page 191 for details).
- ITT—bend tabs may be installed unbent into web stiffeners.
- MIT—optional triangle nail holes may be used for increased uplift capacity. See Optional Nailing For Increased Uplift table.
- HIT—closed PAN nail holes may be used for increased uplift capacity. See Optional Nailing For Increased Uplift table.
- For sloped joists up to 1/4:12 there is no reduction, between 1/4:12 and up to ½:12, tests show a 10% reduction in ultimate hanger strength. Local crushing of the bottom flange or excessive deflection may be limiting; check with joist manufacturer for specific limitations on bearing of this type.

ALLOWABLE LOADS: • The ITS, ITT, MIT and HIT hangers have locations for optional nails if additional uplift is needed. Optional uplift nailing requires the addition of properly-secured web stiffeners. See the load tables for minimum required fasteners and allowable uplift loads.

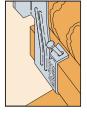

OPTIONS: • Because these hangers are fully die-formed, they cannot be modified. However these models will normally accommodate a skew of up to 5°.

CODES: See page 12 for Code Reference Key Chart.

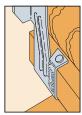

IUT & ITT INSTALLATION (VPA SIMILAR)

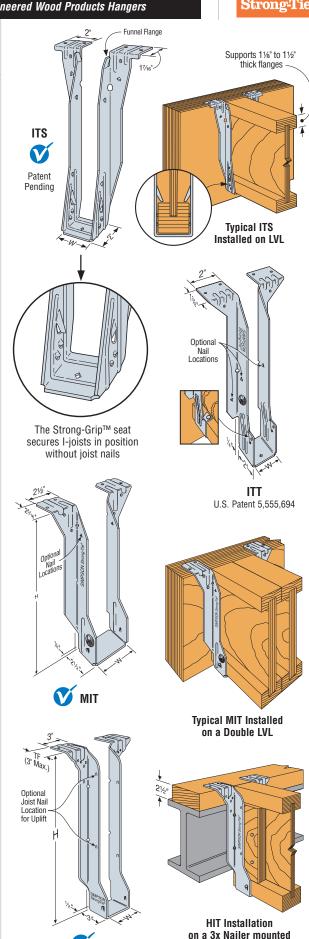

Bend the tab with a hammer.

Hammer 10dx11/2 nail in at approximately 45°.

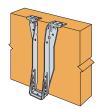

The tab is now correctly installed.

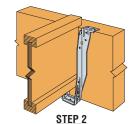

TOP FLANGE HANGERS ITS/ITT/MIT/HIT Engineered Wood Products Hangers

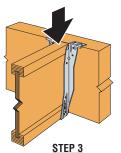

ITS INSTALLATION SEQUENCE

STEP 1 Attach the ITS to the header

Slide the I-joist downward into the ITS until it rests above the Strong-Grip™ seat.

Firmly push or snap I-joist fully into the seat of the ITS.

POSITIVE ANGLE NAILING

Correct Nailing Approx. 45° angle

- 1. Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector® software or conservatively divide the uplift load by 1.6. For SPF/HF use 0.86 x DF/SP uplift load.
- 2. Applies to LVL headers made primarily from Douglas Fir or Southern Pine. For LVL made primarily from Spruce Pine Fir or similar less dense veneers, use the values found in the SPF/HF column.

NAILER TABLE

This table indicates various allowable loads for ITS/ITT/MIT/HIT hangers used on wood nailers. The header nail type must be substituted for those listed in other tables. See technical bulletin T-NAILERUPLFT for other uplift values and options (see page 191 for details).

- 1. These hangers may deflect an additional 1/32" at design load.
- 2. Uplift loads are based on DF/SP members only.

- 3. DF I-joists include flanges made from solid sawn Douglas Fir, LVL made primarily of Douglas Fir/Southern Pine, or LSL. For flanges with thicknesses from 15/16 to 13/8, use 0.85 of the I-joist header load. For flanges with thicknesses from 11/8 to 11/4, use 0.75 of the I-joist header load.
- 4. SCL (structural composite lumber) is LVL, LSL, and Parallam® PSL
- 5. Web stiffeners required for the ITS Alternate Installation when installing optional joist nails for additional uplift load.
- 6. Code Values are based on DF/SP header species.
- 7. I-joists with flanges less than 15/16" thick used in combination with hangers thinner than 14 gauge may deflect an additional 1/32 inch beyond the standard
- 8. For $2\frac{1}{2}$ " and $2\frac{7}{16}$ " wide joists, see tables on pages 96-105 for allowable loads.

Parallam® is a registered trademark of iLevel by Weyerhaeuser.

NAILS: 16d = 0.162" dia. x $3\frac{1}{2}$ " long, $16dx2\frac{1}{2} = 0.162$ " dia. x $2\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

- 1. Loads are based on Doug Fir, and have been increased 60% for wind or earthquake loading with no further increase allowed. Reduce according to the code for normal loading criteria such as in cantilever construction.

 2. Web stiffeners are required on I-joist for additional nailing.

TOP FLANGE HANGERS LBV/BA/B/HB 1-Joist & Structural Composite Lumber Hangers

WEINEERED. This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The BA hanger is a cost effective hanger targeted at high capacity l-joists and common Structural Composite Lumber applications. A min/max joist nail option gives dual use of this hanger. Minimum values featuring positive angle nailing are targeted at l-joist without web stiffeners requirement and the maximum nailing generates higher loads to support structural composite lumber. The unique two level embossment provides added stiffness to the top flange.

The newly improved LBV, B and HB hangers offer wide versatility for I-joists and structural composite lumber. The enhanced load capacity widens the range of applications for these hangers. The LBV still features positive angle nailing and does not require the use of web stiffeners for standard non modified 1-joist installations.

See Top Flange tables on pages 96 to 105. See Hanger Options on pages 181-183 for hanger modifications, which may result in reduced loads.

MATERIAL: See tables, pages 96 to 105.

FINISH: LBV, B, BA and HB—Galvanized; all saddle hangers and all welded sloped and special hangers—Simpson Strong-Tie® gray paint. LBV, B, BA and HB may be ordered hot-dip galvanized; specify HDG.

INSTALLATION: • Use all specified fasteners. See General Notes and nailer table.

- LBV, B, BA and HB may be used for weld-on applications. Weld size to match material thickness (approximate thickness shown). The minimum required weld to the top flanges is 1/8" x 2" fillet weld to each side of each top flange tab for 14 and 12 gauge and 3/16" x 2" fillet weld to each side of each top flange tab for 7 gauge and 10 gauge. Distribute the weld equally on both top flanges. Welding cancels the top and face nailing requirements. Consult the code for special considerations when welding galvanized steel. The area should be well-ventilated, see page 14 for weld information. Weld on applications produce the maximum allowable down load listed. For uplift loads refer to T-WELDUPLFT.
- · LBV hangers do not require the use of web stiffeners for non-sloped or non-skewed applications.
- B and HB hangers require the use of web stiffeners. BA MIN nailing does not require web stiffeners. BA MAX nailing requires the use of web stiffeners.
- Ledgers must be evaluated for each application separately. Check TF dimension, nail length and nail location on ledger.
- Refer to technical bulletin T-SLOPEJST for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes (\leq %:12).

OPTIONS: • LBV, B and HB

- Other widths are available; specify W dimension (the minimum W dimension is 19/16").
- The coating on special B hangers will depend on the manufacturing process used. Check with your Simpson Strong-Tie representative for details. Hot-dip galvanized available: specify HDG.
- Refer to technical bulletin T-BSERIES for the complete line of LBV, BA, B and HB hangers, including models not shown here, their available modification combinations and their associated reduction factors.
- Modified hangers have reduced loads, see Hanger Options, pages 181-183. CODES: See page 12 for Code Reference Key Chart.

NAILER TABLE

The table indicates the maximum allowable loads for LBV, BA, B and HB hangers used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

- 1. Uplift values are for DF/SP members only. LBV and BA hangers resist more uplift when web stiffeners are used. Refer to technical bulletin T-NAILERUPLFT for additional information (see page 191 for details).
- See page 184 for reductions on modified hangers on nailers. B hangers require 6-10dx1½ joist nails to achieve published loads. For joist members 2½" or wider, 16dx2½" joist nails should be installed for additional uplift loads on the 3x and 4x nailer applications of 970 lbs. and 1010 lbs. respectively.

< W-HB LBV BA U.S. Patent 7,334,372 (B Similar) Typical Double LBV **BA Installed LVL** Hanger Installation to LVL Max Nailing Nailer attachment per Designer LBV features positive angle nailing, no web stiffeners are required **BA** installed 2X nailer on steel beam minimum nailing **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long, $16dx2\frac{1}{2} = 0.162$ " dia. x $2\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, BA, B, HB and LBV are 10dx1½ = 0.148" dia. x 1½" long acceptable for weld-on See page 16-17 for other applications (LBV shown)

SIMPSON

 ${f Strong-Tie}$

1. This table assumes joists with $Fc \perp = 750$ psi. For other joists, check that bearing and joist nails are adequate.

See Installation Information.

2. Loads for B's and HB's assume a joist width of 2½" or greater.

nail sizes and information.

3. Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6. For SPF/HF use 0.86 x DF/SP uplift load.

4. Loads may not be increased for short term loading. Web stiffeners required when more than two joist nails are used.

6. SCL (structural composite lumber) is LVL (laminated veneer lumber), LSL (laminated strand lumber), and Parallam® PSL.

Code values are based on DF/SP header species.

8. Applies to LVL headers made primarily from Douglas Fir or Southern Pine. For LVL made primarily from Spruce-Pine-Fir or similar less dense veneers, use the values found in the SPF/HF column.

. DF I-joists include flanges made from solid sawn Douglas Fir, LVL made primarily of Douglas Fir/ Southern Pine, or LSL. For flanges with thicknesses from 15% to 13%, use 0.85 of the I-joist header load. For flanges with thicknesses from 11/8 to 11/4, use 0.75 of the I-joist header load.

I-Joist & Structural Composite Lumber Hangers TOP FLANGE HANGERS W/WP/WPU/WM/WMU/HW/HWU

for details.

Top Flange

The W. WP, WPU, HWU and HW series are designed to hang joists, purlins or beams. WM and WMU hangers are designed for use on standard 8" grouted masonry block wall construction. Some models have an "I" in the model number which indicates a size specific for an I-Joist and have the same properties and modifications as the standard series.

- modifications as the standard series.

 MATERIAL: See tables on pages 96 to 105.

 FINISH: Simpson Strong-Tie® gray paint; HDG available. Contact Simpson Strong-Tie.

 INSTALLATION: Use all specified fasteners. WM—two 16d duplex nails must be installed into the top flange and embedded into the grouted wall. Verify that the header can take the required fasteners specified in the table.

 Hangers may be welded to steel headers with ½" for W, ¾½" for WP, WPU, and ½" for HW, HWU by 1½" fillet welds located at each end of the top flange, see page 14 for weld information. Weld-on applications produce maximum allowable load listed. For uplift loads refer to T-WELDUPLFT (WPU and HWU hangers only).

 Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.

 Hangers can support joists sloped up to ½:12 using table loads. For joists sloping between ½:12 and ¾:12 use 85% of the table loads.

 Web stiffeners are required for standard joist nailing configuration with these hangers.

 MID-WALL INSTALLATION: Installed between blocks with duplex nails cast into grout with a minimum of one grouted course above and below the top flange grouted and one #5 vertical rebar minimum 24" long in each adjacent cell.

 TOP OF WALL INSTALLATION: Install on top of wall to a grouted beam with masonry screws.

 - masonry screws.

OPTIONS: • Specify alternate nailing pattern when web stiffeners are not being used (up to 16" in depth). Add X ANP after model number for nailing into the flange, available for 90° applications only. Uplift loads do not apply to this application.
 • See Hanger Options, pages 181-183 for hanger modifications and associated

load reductions

NAILER TABLE

The table indicates the maximum allowable loads for W, WP and HW hangers used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall

- 1. Uplift values for the WPU and HWU hangers are for depths ≤ 18' and are for DF/SP values only. Refer to uplift values in table below for taller depths.
- 2. Attachment of nailer to supporting member is the responsibility of the Designer.

Correct Nailer Attachment

- 1. 16d sinkers (9 ga x 3") may be used where 10d commons are called out with no load reduction.
- 2. Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6. For SPF/HF use 0.86 x DF/SP uplift load.
- SCL, structural composite lumber, is laminated veneer lumber, laminated strand lumber, and Parallam® PSL.
 Applies to LVL headers made primarily from Douglas Fir or Southern Pine.

with Alternate Nailing

Pattern (ANP)

- For LVL made primarily from Spruce Pine Fir or similar less dense veneers, use the values found in the SPF/HF column.

 1-joist header with SPF/HF flanges will support 2030 lbs.

 WP quantity of nail holes in top flange varies.

 Top Flange Hangers on the following pages with "I" in the model name (e.g. HWI) use the same design information in the above tables for the models without the "I" in the name (e.g. HW).

 Minimum f'm = 1500 psi. Refer to Installation Notes for further explanation of applications.

 For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.

 NAILS: 16d and 16d DPLX = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.
- Parallam® is a registered trademark of iLevel by Weyerhaeuser.

GLTV/HGLTV Heavy Duty Hangers

GLTV and HGLTV hangers are designed for structural composite lumber header applications that require high loads. The top flange nails are sized and specifically located to prevent degradation of the header due to splitting of laminations.

For heavy loads with a face-mount application, see the HGUS and GU series.

MATERIAL: Top flange—3 gauge; Stirrups—7 gauge

FINISH: Simpson Strong-Tie® gray paint; HDG available. Contact Simpson Strong-Tie.

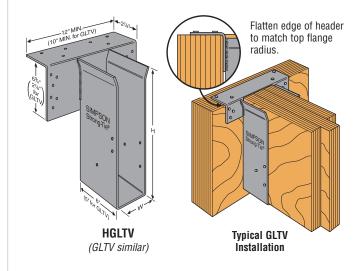

INSTALLATION: • Use all specified fasteners. Verify that the header can take the required fasteners specified in the table.

- . This series may be used for weld-on applications. Minimum required weld is a 3/16" x 21/2" fillet weld at each end of the top flange for GLTV, and a 1/4" x 21/2" fillet weld at each end of the top flange for HGLTV, see page 14 for weld information. Weld-on applications produce maximum loads listed. For uplift loads refer to T-WELDUPLFT.
- Web stiffeners are required with I-joists using this hanger style.
- GLTV hangers may be attached to a 4x nailer and achieve full table loads or they can be installed to a double 2x nailer or a 3x nailer with 16dx2½" nails and achieve 0.84 of the published loads. HGLTV hangers should not be attached to nailers. GLTV or HGLTV hangers may be installed on ledgers provided the ledgers are made of 4x solid sawn or 3½" SCL shown in the table below. Thinner lumber must be evaluated by the building Designer.

OPTIONS: • Hot-dip galvanized: specify HDG.

• See Hanger Options, pages 181-183. Saddle hanger versions are available in some engineered wood sizes.

CODES: See page 12 for Code Reference Key Chart.

Madel		Fasteners			All	owable Load	s Header Typ	е		0-4-

- 1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™software or conservatively divide the uplift load by 1.6.
- 2. Uplift loads only apply when "H" is 28" or less.
- 3. For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.
- 4. HGLTV at maximum allowable load may have greater than 1/8" deflection.
- 5. Applies to LVL headers made primarily from Douglas Fir or Southern Pine. For LVL made primarily from Spruce Pine Fir or similar less dense veneers, use the values found in the SPF/HF column.
- 6. NAILS: 16d = 0.162" dia. x $3\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

EGQ High Capacity Hanger

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The EGQ hanger is a high capacity top flange connector designed for use with Structural Composite Lumber beams. It utilizes Simpson Strong-Tie® Strong-Drive® screws (SDS) for higher capacity and ease of installation. Available in standard SCL widths and made to specified heights. SDS screws are included.

MATERIAL: Top flange—3 gauge; Stirrups—7 gauge

FINISH: Simpson Strong-Tie gray paint; HDG available. Contact Simpson Strong-Tie.

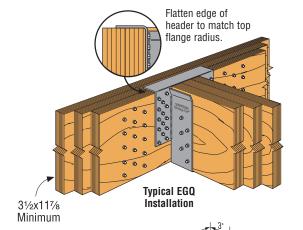

INSTALLATION: • Use all specified fasteners. See General Notes.

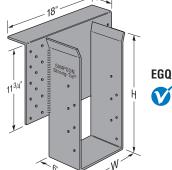

- Install with Simpson Strong-Tie SDS 1/4"x3" wood screws, which are provided with the EGQ. (Lag screws will not achieve the same load.)
- All multiple members must be fastened together to act as a single unit.
- · Multiple member headers may require additional fasteners at hanger locations. Quantity and location to be determined by designer. See SDS section for additional information and SDS screws applications.

OPTIONS: • See Hanger Options pages 181-183.

- 1. Loads are based on 750 psi wood bearing for SCL.
- 2. "Min H" is the minimum H dimension that may be specified.
- 3. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading such as in cantilever construction use an uplift value of 4800 lbs.

MSC Multiple Seat Connector

The MSC supports the ridge and two valleys for roof construction. Ideal for dormer roof applications.

MATERIAL: Top flange—3 gauge, Stirrups—11 gauge (MSC2 and MSC1.81), 7 gauge (MSC4 and MSC5)

FINISH: Simpson Strong-Tie® gray paint; HDG available. Contact Simpson Strong-Tie.

INSTALLATION: • Distribute the total load evenly about the centerline to avoid eccentric loading.

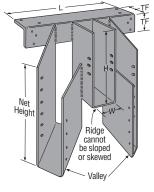

- · Fasten all built-up members together as one unit.
- Net height will be calculated based on specified valley member depth and slope by the factory unless noted otherwise.

SLOPED AND/OR SKEWED VALLEYS

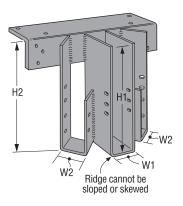

- The valley stirrups can be sloped to 45° and skewed from 25° to 45°. (MSC5 skewed 20°-45°.)
- The total design load of the hanger is split between the ridge (20%) and each valley (40%).
- MSC connectors can be used for two valley connections with no ridge member. Divide the total load by two for each valley load.

- 1. Loads may not be increased for short-term loading.
 2. Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively divide the uplift load by 1.6. For SPF/HF use 0.86 x DF/SP uplift load.
- 3. WM loads listed are based on embedded installation (mid-wall) into a masonry block wall. (See page 70)
- 4. When I-joist is used as header, all nails must be 10dx1½ and allowable loads assume flanges that are at least 1½" thick made of Douglas Fir, LVL or LSL. For other flange thicknesses, apply load adjustment factors found in the table below.
- 5. Hangers sorted in order of recommended selection for best overall performance and installation value.
- 6. Other nail schedules and loads are listed on pages 91-93.
- See pages 91 to 95 for Code reference numbers.
- 8. Web stiffeners are required where noted and when supporting double I-joists with flanges less than 15/16" thick.
- 9. For 2'%"x22" and 24" joist sizes, refer to technical bulletin T-BSERIES08 (see page 191 for details).

 10. NAILS: 16d and 16d DPLX = 0.162" dia. x 3½" long,
- 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

LSU/LSSU/LSSUI Light Slopeable/Skewable U Hangers for I-Joists and SCL

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

This series attaches joists or rafters to headers, sloped up or down, and skewed left or right, up to 45°.

MATERIAL: See table FINISH: Galvanized

INSTALLATION: • Use all specified fasteners.

See General Notes.

- · Attach the sloped joist at both ends so that the horizontal force developed by the slope is fully supported by the supporting members.
- · Web stiffeners required for I-joist applications.
- To see an installation video on this product, visit www.strongtie.com.

CODES: See page 12 for Code Reference Key Chart.

LSU and LSSU INSTALLATION SEQUENCE

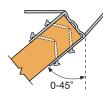

(For Skewed or Sloped/Skewed Applications)

STEP 1

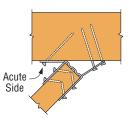

Engineered Wood & Structural Composite Lumber Connectors

Nail hanger to slope-cut carried member, installing seat nail first. No bevel necessary. Install joist nails at 45° angle.

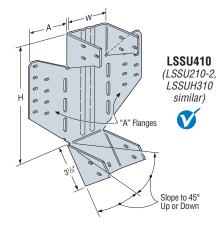

STEP 2

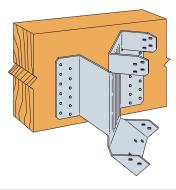

Skew flange from 0-45°. Bend other flange back along centerline of slots until it meets the header Bend one time only.

STEP 3

Attach hanger to the carrying member, acute angle side first (see foonote 5). Install nails at an angle

The LSU5.12 must be factoryskewed 0° to 45°. It may be fieldsloped to 45°. (LSU4.12, LSU4.28 and LSU3510-2 similar)

Hanger shown skewed right

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Roof loads are 125% of floor loads unless limited by other criteria.
- 2. Uplift loads include a 60% increase for wind or earthquake loading with no further increase is allowed; reduce where other loads govern.
- 3. LSU3510-2, LSU4.12, LSU4.28 and LSU5.12 skew option must be factory-ordered.
- 4. Minimum 11" joist height for LSU3510-2, LSU4.12, LSU5.12; 9½" for all others.
- 5. For skewed LSSU/LSSUI hangers, the inner most face fasteners on the acute angle side are not installed.
- 10dx11/2" nails may not be used for face nails on skewed or sloped and skewed _SU/LSSU/LSSUI hangers.
- 7. NAILS: 16d = 0.162" dia. x 31/2" long, 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

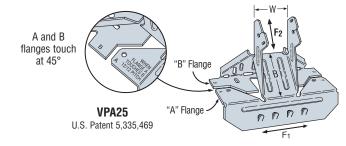

VPA Variable Pitch Connector

The VPA may be sloped in the field, offering a versatile solution for attaching rafters to the top plate. It will adjust to accommodate slopes between 3:12 and 12:12, making it a complement to the versatile LSSU. This connector eliminates the need for notched rafters, beveled top plates and toe nailing.

MATERIAL: 18 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

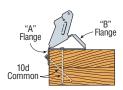

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Loads may not be increased for short-term loading.
- 3. NAILS: 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

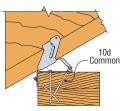

VPA INSTALLATION SEQUENCE

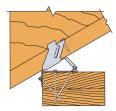

STEP 1
Install top nails and face PAN nails in "A" flange to outside wall top plate.

STEP 2
Seat rafter with a hammer, adjusting "B" flange to the required pitch.

STEP 3
Install "B" flange nails in the obround nail holes, locking the pitch.

STEP 4
Bend 11½" nail into tab nail hole.
10dx11½" nail into tab nail hole.
Hammer nail in at an approximate 45° angle to limit splitting.

HCP Hip Corner Plates

For complementary ridge connection, see page 108

The HCP connects a rafter or joist to double top plates at a 45° angle.

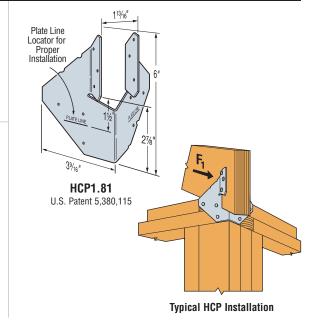

MATERIAL: 18 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- Attach HCP to double top plates; birdsmouth not required for table loads.
- Install rafter and complete nailing. Rafter may be sloped to 45°.

Member Size	Model No.	Faste	eners		/SP vable ads	SPF Allow Loa	Code Ref.	
Size	NU.	To	To	(16	60)	(16	nei.

- 1. Loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- The HCP can be installed on the inside and the outside of the wall with a flat bottom chord truss and achieve twice the load capacity.
- 3. **NAILS:** 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

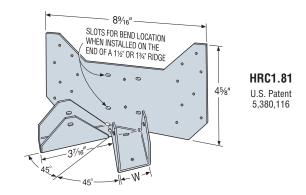

MATERIAL: 16 gauge FINISH: Galvanized INSTALLATION:

Engineered Wood & Structural Composite Lumber Connectors

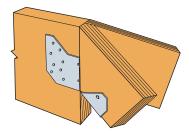

- Use all specified fasteners. See General Notes.
- On end of ridge—use optional diamond holes to secure the HRC. Bend face flanges back flush with ridge, and complete nailing.
- On face of ridge-adjust to correct height and install nails.
- Double bevel-cut hip members to achieve full bearing capacity.
- The HRC may be sloped to 45° with no reduction in loads.

CODES: See page 12 for Code Reference Key Chart.

- Allowable loads shown are for each hip. Total load carried by the connector is double this number.
- Uplift loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 3. Roof loads are 125% of floor loads unless limited by other criteria.
- 4. **NAILS:** 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

Typical HRC Installation on the End of a Ridge

Optional HRC1.81 Installation

SUR/SUL/HSUR/HSUL Skewed 45° Hangers for I-Joist and SCL

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The SUR/L1.81, 2.06, 2.1, 2.37, 2.56 and HSUR/L series are 45° skewed hangers designed specifically to ease the installation of single and double l-joists. In addition to Positive Angle Nailing these hangers encapsulate the top flange of the l-joist, so no web stiffeners are required for standard installation.

The full range of 45° skewed hangers feature obround nail holes on the acute side allowing nails to be easily installed parallel to the joist. Installation is further simplified with no required bevel cuts.

MATERIAL: See table

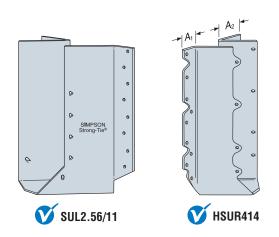

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

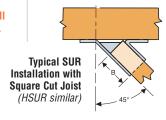

INSTALLATION: • Use all specified fasteners. See General Notes.

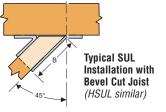

- Illustrations show left and right skews SUR/L (SUR = skewed right; SUL = skewed left).
- The joist end may be square cut or bevel cut.
- Fill all round and obround nail holes with specified fasteners to achieve table loads. Where noted, triangle holes in the joist flange may be filled for additional uplift capacity (see footnote on page 109).
- For I-joists with flanges less than 15%, web stiffeners are required for all double joist hangers when using hangers that are 14 gauge and lighter.
- For installations to masonry or concrete, see page 140.

OPTIONS: • These hangers will accommodate a 40° to 50° skew.

 Available with the A₂ flange turned in on 2-2x and 4x models only (see illustration). For example, specify HSURC410, HSULC410, SURC210-2, or SULC210-2.

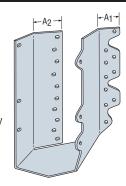

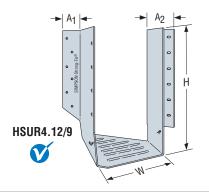

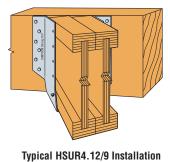

SUR/SUL/HSUR/HSUL Skewed 45° Hangers for I-Joist and SCL

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Uplift loads have been increased by 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern. 2. Roof construction loads are 125% of floor loads unless limited by other criteria.

- 3. Triangle nail holes may be filled (requires web stiffeners) with 10dx1½" nails for additional uplift.

 9- and 11-inch models have (4) additional holes, that when filled can resist 795 lbs. for Douglas Fir or Southern Pine or 685 lbs. for SPF/HF.
 - 14-inch models have (6) additional holes, that when filled can resists 1190 lbs. for Douglas Fir and 1025 lbs. for SPF/HF.
- 4. When the supported member is an I-joist with flanges less than 15% inches thick, the allowable uplift shall not exceed 190 lbs. without web stiffeners.
- 5. NAILS: 16d = 0.162" dia. x $3\frac{1}{2}$ " long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

PAI/MPAI Purlin Anchors

Wood-to-concrete and wood-to-CMU connectors that satisfy code requirements. The PA's dual embedment line allows installation in concrete or concrete block.

MATERIAL: MPAI—14 gauge; PAI—12 gauge

FINISH: Galvanized. Some products available HDG or ZMAX® coating.

INSTALLATION: • Minimum concrete strength is 2000 psi.

- · Use all specified fasteners; some models have extra fastener holes. See General Notes.
- Wood splitting may occur when anchor is nailed to wood less than 3½" wide. To reduce splitting for widths less than 3½", fill every other nail hole with 10dx11/2" nails. Reduce the allowable load based on the size and quantity of fasteners used. (See nail table on page 16-17.)
- PAI is designed for wood I-joists. Nail spacing is for 10dx11/2" nails 3" on center, to minimize the chance of wood splitting. Maximum ledger width for full loads is $1\frac{1}{2}$ ".

EDGE DISTANCE—Minimum concrete edge distance is 5".

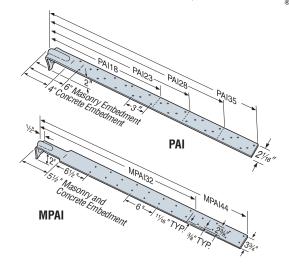

Minimum concrete block left-to-right edge distance is 20".

CONCRETE BLOCK WALLS—The masonry embedment line on PAI, MPAI allows for 4" of grout embedment in a standard 8" concrete masonry unit. The minimum wall specifications are: one #4 vertical rebar, 32" long, at 32" o.c.; two courses of block above and below the anchor; a horizontal bond beam with two #4 rebars, 40" long, a maximum of two courses above or below the anchor; all cells grouted with 2000 psi 3/8" aggregate grout. Grout shall be vibrated per the 1997 UBC section 2104.6.2.

OPTIONS: See LTT and HTT Tension Ties.

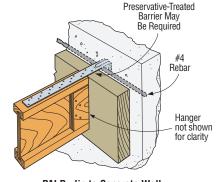

CODES: See page 12 for Code Reference Key Chart.

Note: IBC 1613.1 refers to ASCE7 for seismic design procedures which states in Section 12.11.2.2.5:

Diaphragm to structural wall anchorage using embedded straps shall be attached to, or hooked around the reinforcing steel, or otherwise terminated to effectively transfer forces to the reinforcing steel.

PAI Purlin to Concrete Wall (MPAI similar)

- 1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Allowable loads are for a horizontal installation into the side of a concrete or masonry wall.
- 3. **NAILS:** $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

RC Ripper Clip

The Ripper Clip is designed to connect ripped 2x framing to the top of another wood joist.

MATERIAL: 20 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. Refer to General Notes.

• Attach RC to ripper, then attach ripper/RC assembly to roof joist.

CODES: See page 12 for Code Reference Key Chart.

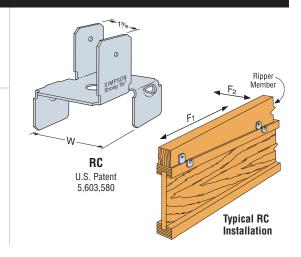

Model No.	w	Faste	eners	Allowable Uplift Load	F ₁	F ₂	Code Ref.
NU.		Ripper	Joist	(160)			1161.

RC1.81	113/16	2-10dx1½	2-10dx1½	205	240	205	170
RC2.1	21/8						

- Allowable loads are for DFL ripper members.
- Uplift loads have been increased 60% for wind or earthquake loading with no other increase allowed. Reduce by 60% for normal loading.

 Designer to consider stability/blocking requirements for system, if necessary.

- 4. Spacing of RC per Designer.

 5. NAILS: 10dx1½ = 0.148 dia. x 1½" long. See page 16-17 for other nail sizes and information.

FACE MOUNT HANGERS HU/HUC/HUCQ/HGUS Glulam Beam & Double Shear Joist Hangers

SIMPSON Strong-Tie

See Hanger Options on pages 181-183 for hanger modifications, which may result in reduced loads.

HU/HUC—Most models have triangle and round holes. To achieve maximum loads, fill both round and triangle holes with common nails.

HGUS—Face mount hanger used for high load applications. All hangers in this series have double shear nailing. This patented innovation distributes the load through two points on each joist nail for greater strength. It also allows the use of fewer nails, faster installation, and the use of common nails for all connections. (Do not bend or remove tabs)

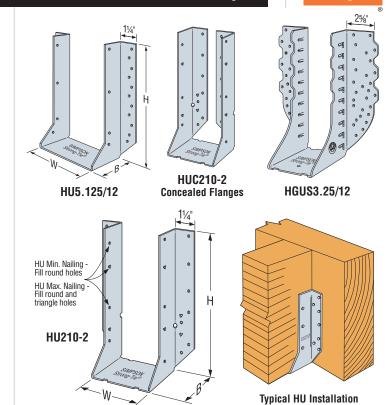

MATERIAL: See tables

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

- HU/HUC—can be installed filling round holes only, or filling round and triangle holes for maximum values.
- HGUS—Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- With 3x carrying members, use 16dx2½" (0.162" dia. x 2½" long) nails into the header and 16d commons into the joist with no load reduction. With 2x carrying members, use 10dx1½" (0.148" dia. x 1½" long) nails into the header and 10d commons into the joist, and reduce the load to 0.64 of the table value.
- For installations to masonry or concrete, see page 140.
 OPTIONS: HU hangers available with the header flanges turned in for 2%/6" and larger widths, with no load reduction—order HUC hanger.
 - See Hanger Options on pages 181-183, for sloped and/or skewed HU models, and HUC (concealed flange) models.
 - · Concealed flanges are not available for HGUS.
 - · Other sizes available; contact Simpson Strong-Tie.
 - · See also HUS series.

CODES: See page 12 for Code Reference Key Chart.

Double Shear Nailing Top View

Double Shear Nailing Side View Do not bend tab

Dome Double Shear Nailing Side View (available on some models)

U.S. Patent 5,603,580

Projection seat on most models for maximum bearing and section economy. Model configurations may differ from those shown. Some HU models do not have triangle holes. Contact Simpson Strong-Tie for details.

- 1.10d commons or 16d sinkers may be used instead of the specified 16d at 0.84 of the table load value.
- 2.16d sinkers may be used instead of the specified 10d commons with no load reduction.
- 3. Uplift loads based on Douglas Fir and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™software or conservatively divide the uplift load by 1.6.
- 4. MIN nailing quantity and load values—fill all round holes; MAX nailing quantity and load values—fill all round and triangle holes.
 5. For SPF/HF uplift, use 0.86 x DF/SP uplift load for products
- requiring nails and 0.72 for products requiring screws.
- 6. NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

LGU/MGU/HGU/HHGU High Capacity Girder Hangers

The GU hangers are high-capacity girder hangers designed for situations where the header and joist are flush at the top. These products can be used for retrofit on the framing members after they are temporarily placed in position. Simpson Strong-Tie® Strong-Drive® screws (SDS) make installation fast and easy, with no pre-drilling required.

MATERIAL: See table

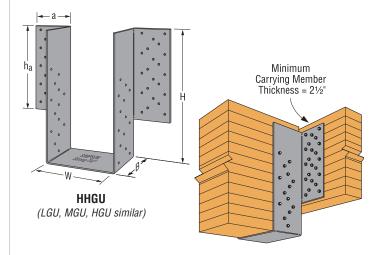

FINISH: Galvanized, HHGU—Simpson Strong-Tie® gray paint INSTALLATION: • Use all specified fasteners. See General Notes.

- Install with Simpson Strong-Tie SDS 1/4"x21/2" screws, which are provided with the GU's. (Note: lag screws will not achieve the same loads.)
- · All multiple members must be fastened together to act as a single unit.
- · Multiple member headers may require additional fasteners at the hanger locations. The quantity and location of the additional fasteners must be determined by the Designer.
- For installation to concrete or masonry walls see LGUM and HGUM hangers page 141.

OPTIONS: • Hot-dip galvanized available. Order as "X" version, specify HDG.

- Other seat widths available. Order as "X" version, specify width.
- See Hanger Options, pages 181-183, for one flange concealed option (except MGU3.63, MGU5.25 and HGU5.25).

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift loads have been increased for wind or earthquake loading with no further increase allowed.
- 2. Specify H dimension. Maximum H = 30".
- 3. Header height must be at least as tall as the flange height (ha).

TOP FLANGE HANGERS HHB/GB/HGB Beam & Purlin Hangers

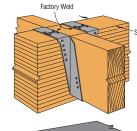

See table on page 115. See Hanger Options on pages 181-183 for hanger modifications, which may result in reduced loads.

This series of beam and purlin hangers may be used for wood to wood or wood to steel applications. Precision forming provides dimensional accuracy and helps ensure proper bearing area and connection. MATERIAL: See table on page 115

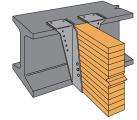

FINISH: HHB, GB, HGB, all saddle hangers and all welded sloped and special hangers— Simpson Strong-Tie® gray paint. HHB may be ordered hot-dip galvanized; specify HDG. INSTALLATION: • Use specified fasteners. See General Notes.

- HHB, GB and HGB may be used for weld-on applications. The minimum required weld to the top flanges is 3/e* x 2* fillet weld to each side of each top flange tab. Distribute the weld equally on both top flanges. Welding cancels the top and face nailing requirements. Consult the code for special considerations when welding galvanized steel. The area should be well-ventilated. See page 14 for weld information. Weld on applications produce the maximum allowable load listed. Uplift loads do not apply to welded applications.
- Ledgers must be evaluated for each application separately. Check TF dimension, nail length and nail location on ledger.

- OPTIONS: HHB-other widths are available; specify W dimension (the minimum W dimension is 2½").
 Saddle hangers are made to order; add "D" to model (e.g. HHBD3); specify S (for saddle) dimension. They may be used for most conditions except at end wall locations, and are preferred for nailer applications.
 - The coating on special B hangers will depend on the manufacturing process used. Check with your Simpson Strong-Tie representative for details. Hot-dip galvanized available: specify HDG.
 - · B dimensions may be increased on some models.
 - See Hanger Options, pages 181-183.

Typical HHB, **GB** and HGB Saddle Installation

HHB, GB and HGB are acceptable for weld-on applications. See Installation Information.

WPU

HW

(HWU similar)

TOP FLANGE HANGERS WM/WMU/WP/WPU/HW/HWU

The WPU, HWU and HW series purlin hangers offer the greatest design flexibility and versatility. MATERIAL: WP/WPU—7 ga. top flange, 12 ga. stirrup; HW—3 ga. top flange, 11 ga. stirrup; HWU—3 ga. top flange, 10 ga. stirrup; HWU—3 ga. top flange, 10 ga. stirrup
FINISH: Simpson Strong-Tie gray paint; hot-dip galvanized available: specify HDG.

INSTALLATION: • Hangers may be welded to steel headers with %1e" for WPU/WP, and 1/4" for HW/HWU, by 11/2" fillet welds located at each end of the top flange. Weld-on applications produce maximum allowable load listed. See page 14 for weld information. For uplift loads refer to technical bulletin T-WELDUPLET (see page 191 for details).

- · Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.
- MID-WALL INSTALLATION: Installed between blocks with duplex nails cast into grout with a minimum of one grouted course above and below the top flange and one #5 vertical rebar minimum 24" long in each adjacent cell.
- TOP OF WALL INSTALLATION: Install on top of wall to a grouted beam with masonry screws. **OPTIONS**: See Hanger Options, pages 181-183, for hanger modifications and associated load reductions. CODES: See page 12 for Code Reference Key Chart.

WM

NAILER TABLE

The table indicates the maximum allowable loads for WP, WPU, HW or HWU hanger used on wood nailers. Nailers are wood members attached to the top of a steel I-beam, concrete or masonry wall.

- 1. Uplift value for the HWU hanger is for depth ≤ 18". Refer to uplift values in table below for taller depths
- 2. Attachment of nailer to supporting member is the responsibility of the Designer. See page 19 for TB screws attachment option.

TOP FLANGE HANGERS GLS/HGLS/GLT/HGLT Beam & Glulam Saddle Hangers

See table on page 115. See Hanger Options on pages 181-183 for hanger modifications, which may result in reduced loads.

GLT and HGLT accommodate typical structural requirements for timber and glulam beams. GLT top flange depth allows installation on minimum 4x ledger (31/2" net). Not acceptable for nailer applications. Funnel Flanges® allow easy installation of beams.

GLS and HGLS are heavy glulam saddle hangers. Tested and code-listed seismic tie provisions are added to the GLS or HGLS—order GLST or HGLST. The seismic tie models use three extra 3/4" bolts through each carried member and two 3/4" bolts through the supporting member. Bolt holes shall be a minimum of 1/32" to a maximum of 1/16" larger than the bolt diameter (2005 NDS 11.1.2.2).

MATERIAL: All welded GL series glulam hangers have a 3 gauge top flange. See page 115 for stirrup gauge.

FINISH: Simpson Strong-Tie® gray paint. Hot-dip galvanized available; specify HDG.

INSTALLATION: • Use all specified fasteners. See General Notes.

GLT/HGLT • All GLTs used with sawn timbers have a 12" L dimension.

- · Fasteners are included.
- GLT may be attached to steel headers by 3/16" x 21/2" fillet welds at each end of the header angle to obtain the tabulated loads. HGLT may be attached to steel headers by 1/4" x 21/2" fillet welds at each end of the header angle to obtain the lesser of the tabulated loads or 12,000 lbs. For uplift loads refer to technical bulletin T-WELDUPLFT (see page 191 for details). See page 14 for weld information.
- . Not for use with SCL or LVL headers. See GLTV, HGLTV.

GLS/HGLS • N54A nails are included with the hangers.

- Seismic Ties: the carried member bolts should be located in the upper half of the 13/16" x 11/2" slotted holes. Standard washers must be used with all bolts.
- Loads listed are per stirrup.

TO ORDER: • GLS/HGLS-Specify H1, H2, and S dimensions (see illustration).

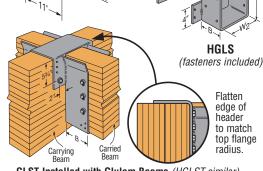

· Some engineered wood sizes are also available.

OPTIONS: See Hanger Options pages 181-183. No options on GLST and HGLST.

TOP FLANGE HANGERS LEG/MEG/EG Beam & Glulam Hangers

See Hanger Options on page 182-183 for hanger modifications, which may result in reduced loads.

Designed to support large members typically found in glulam beam construction.

MATERIAL: See table

FINISH: Simpson Strong-Tie gray paint. Hot-dip galvanized available; specify HDG.

INSTALLATION: • Use all specified fasteners. See General Notes.

OPTIONS: • See Hanger Options, pages 181-183.

· Models available without top flanges; see table loads.

CODES: See page 12 for Code Reference Key Chart.

- 1. Roof loads are 125% of floor loads unless limited by other criteria
- 2. Allowable loads assume a carrying member width of 51/2".
- Specify H dimension.

4. Triangle Theory: Some code jurisdictions allow only half of the top flange bearing area to be considered when performing a top flange hanger calculation as there is non-uniform stress under the top flange (presumed to be a triangular shaped distribution). Therefore, loads are published above using the calculated "Triangle Theory". Loads are also published in the "No Triangle Theory" columns which are based on calculations assuming full bearing on the top flange which do not exceed the tested value with a reduction factor of 3.

1. N54A fasteners are supplied with hangers.

with no further increase allowed.

- 2. Roof loads are 125% of floor loads unless limited by other criteria.
- 3. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie[®] Connector Selector™ software or conservatively divide the uplift load by 1.6.
- 4. GLT, HGLT, GLS, HGLS uplift loads only apply when "H" is 28" or less.
- Allowable loads for glulam sizes are based on 560 psi wood bearing.
 Maximum allowable horizontal load for the GLST/HGLST is 14580 lbs. (160). Load is horizontal across the supporting member and independent of vertical loads and includes a 60% increase for wind or earthquake loading
- "Min H" is the minimum H dimension that may be specified. For GLT, HGLT, GLS, HGLS hanger heights that exceed the joist height, allowable load is 0.50 of the table load.
- Allowable loads assume GLS, GLST, HGLS and HGLST loads are distributed evenly on each side of the header with loads shown for each stirrup. When the load is not evenly distributed, use the equivalent single-sided top flange hanger allowable load for each side. (e.g., for uneven load distribution on a GLS3-5, use the GLT3 allowable loads for each side.)
- 9. GLS, GLST, HGLS, HGLST fasteners listed are for one side only. Fasteners supplied are for both sides of the saddle.
- 10. SPEC: Specify the header dimensions for the saddle hangers. ("S" dimension is illustrated on pages 113-114.)
- 11. NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, N54A = 0.250" dia. x 2½" long annular ring. See page 16-17 for other nail sizes and information.

CODES: See page 12 for Code Reference Key Chart.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

HCA Hinge Connectors

HCAs offer single-piece side plates, for fewer welds and higher horizontal loads.

MATERIAL: Side plates—7 gauge; Top and bottom plates—see PT dimensions in table. FINISH: Simpson Strong-Tie® gray paint

INSTALLATION: • Use all specified fasteners. See General Notes.

- \bullet Bolt holes shall be a minimum of 1/32" and a maximum of 1/16" larger than the bolt diameter (per 2005 NDS 11.1.2.2).
- The model number column in the Allowable Download Table gives the basic HCA model with two rotation bolts.
- Contact Simpson Strong-Tie for heights greater than 60".
- Position 3/4" dia. machine bolts in slots away from bearing seat to allow for wood shrinkage.

OPTIONS: The Horizontal Load Table gives other bolt options.

ORDERING: • To order, add the width and bearing plate size designation after the model name. Specify the H dimension. For dapped beams, reduce the

H dimension by the PT dimension for each dap.
• Specify Model No., Model Size, and height H. Ordering Example: HC4C3TA5-6 H = 18"

CODES: See page 12 for Code Reference Key Chart.

Refer to technical bulletin T-HCAGUIDE for specification examples and additional information (see page 191 for details).

HORIZONTAL LOAD TABLE

Model No. (Prefix)	L	H³ Min	H Max	Rotation Bolts Per Beam	Slotted Tension Bolts	Allowable Horizontal Loads ^{2,3}

- 1. For H dimension between H₁ and Minimum H, decrease allowable loads in direct proportion to depth.
- Loads include a 25% increase for roof live loads; reduce for other load durations according to the code.
- 3. Loads are for 560 psi wood bearing.
- 4. See Horizontal Load Table for models with three rotation bolts.
- 5. Other widths are available for structural composite lumber. Contact Simpson Strong-Tie.
- 6. Beams must be the same width for both members in the connection. For alternate applications, contact Simpson Strong-Tie.

THA/THAC Adjustable Truss Hangers

WEINEER ED This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The THA series have extra long straps that can be field-formed to give height adjustability and top flange hanger convenience. THA hangers can be installed as top flange or face mount hangers.

THA4x and THA2x-2 models feature a dense nail pattern in the straps, which provides more installation options and allows for easy top flange installation. MATERIAL: See table

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

The following installation methods may be used:

• Top Flange Installation—The straps must be field formed over the header – see table for minimum top flange requirements. Install top and face nails according to the table. Top nails shall not be within 1/4" from the edge of the top flange members.

For the THA29, nails used for joist attachment must be driven at an

- For the IHAZ9, nails used for joist attachment must be driven at an angle so that they penetrate through the corner of the joist and into the header. For all other top flange installations, straighten the double shear nailing tabs and install the nails straight into the joist.

 Face Mount Installation—Install all face nails according to the table. Not all nail holes will be filled on all models. On models where there are more nail holes than required, the lowest 4 face holes must be filled. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.
- Alternate Installation— The THA 4x hangers may be installed in a top flange configuration using the tabulated fasteners for face mount installation and achieve the face mount installation loads. Install the tabulated face nails into the face and top of the carrying member. Nails used for the joist attachment must be driven at an angle so that they penetrate through the corner of the joist into the header.

 OPTIONS: • THA hangers available with the header flanges turned in for 35%" (except THA413) and larger, with no load reduction – order THAC hanger.

These products are available with additional corrosion protection. Additional products on

this page may also be available with this option, check with Simpson Strong-Tie for details

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift has been increased 60% for wind or earthquake loading with no
- further increase allowed; reduce where other loads govern.

 2. Wind (160) is a download rating.

 3. For single 4x2 top chord carrying members or single 2x nailers, the following THA hangers can be installed using 10dx1½" top nails and 2-16d face nails with reduced allowable loads as noted: 1415 lbs. for THA418 and THA422, 2255 lbs. for THA426, and 2345 lbs. for THA422-2 and THA426-2. Loads are based on hanger installations at panel points 4. Face mount installation loads are based on minimum of 2-ply 2x carrying
- member. For single 2x carrying members, use 10dx11/2" nails into the
- carrying member and tabulated fasteners into the carried member, and use 0.80 of the
- table value for 18 gauge, and 0.68 of the table value for 16 gauge and 14 gauge.

 5. Min. Top Flange refers to the minimum length of strap that must be field formed over
- 6. For the THA2X models, one strap may be installed vertically according to the face mount nailing requirements and the other strap wrapped over the top chord according to the top flange nailing requirements (see drawing above) and achieve full tabulated top flange installation
- downloads. The THA29 allowable uplift for this application is 575 lbs.

 7. NAILS: 16d = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

LUS/MUS/HUS/HHUS/HGUS/HUSC Double Shear Joist Hangers

SIMPSON ${f Strong-Tie}$

WEINEERED .

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

All hangers in this series have double shear nailing - an innovation that distributes the load through two points on each joist nail for greater strength. This allows for fewer nails, faster installation, and the use of all common nails for the same connection.

Double shear hangers range from the light capacity LUS hangers to the highest capacity HGUS hangers. For medium load truss applications, the MUS offers a lower cost alternative and easier installation than the HUS or THA hangers, while providing greater load capacity and bearing than the LUS. MATERIAL: See tables below and on page 119

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION • Use all specified fasteners. See General Notes.

- Nails must be driven at an angle through the joist or truss into the header to achieve the table loads.
- Not designed for welded or nailer applications.

OPTIONS: • LUS and MUS hangers cannot be modified.

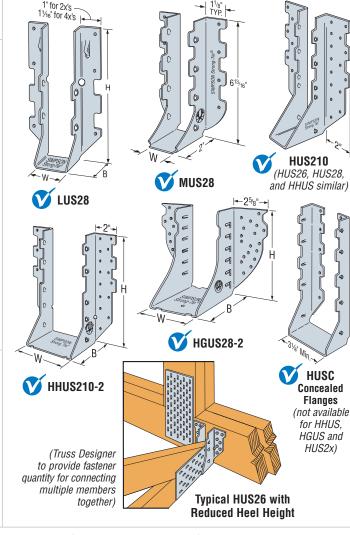

- · HUS hangers available with the header flanges turned in for 2-2x (31/8") and 4x only, with no load reduction. See HUSC Concealed Flange illustration.
- · Concealed flanges are not available for HGUS and HHUS.
- · See Hanger Options, pages 181-183, for sloped and/or skewed HHUS models.
- Other sizes available; consult your Simpson Strong-Tie representative.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Allowable loads shown consider ANSI/ TPI 1-2007 member design criteria.
- 2. For allowable loads on 2x10 girder bottom chords, multiple ply hangers and on SPF/HF header wood species refer to technical bulletin T-REDHEEL (see page 191 for details)
- 3. HGUS, HHUS and HGUQ hangers installed with the joist fastener quantities shown above are recommended for installation on minimum 2-ply 2x girder bottom chords. See technical bulletin T-REDHEEL for HHUS and HGUQ allowable loads (see page 191 for details).
- 4. Allowable loads are based on the lowest joist fastener holes filled. For the LUS, fill the two lowest joist fasteners holes on the right side of the hanger and the single lowest ioist fastener hole on the left side of the hanger.
- 5. Wind (160) is a download rating. 6. **NAILS:** 16d = 0.162" dia. x 3½" long. $16dx2\frac{1}{2} = 0.162$ " dia. x $2\frac{1}{2}$ " long, 10d = 0.148" dia.x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long, See page 16-17 for other nail sizes

- 1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™ software or conservatively
- divide the uplift load by 1.6.

 2. Wind (160) is a download rating.

 3. Minimum heel height shown is required to achieve full table loads. For less than minimum heel height, see Allowable Loads with Reduced Heel Height on page 118.
- 4. Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins
- T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).
- 5. Loads shown are based on minimum of 2-ply 2x carrying member. With 3x carrying members, use 16dx2½" nails into the header and 16d commons into the joist with no load reduction. With single 2x carrying members, use 10dx11/2" nails into the header and 10d commons into the joist, and reduce the load to 0.64 of the table value.
- 6. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

The HTU face mount truss hangers have nail patterns designed specifically for shallow heel heights, so that full allowable loads (with minimum nailing) apply to heel heights as low as 3%". Minimum and maximum nailing options provide solutions for varying heel heights and end conditions.

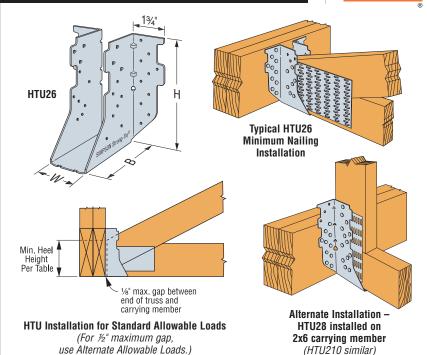

Alternate allowable loads are provided for gaps between the end of the truss and the carrying member up to 1/2" max. to allow for greater construction tolerances (maximum gap for standard allowable loads is 1/8" per ASTM D-1761 and D-7147).

MATERIAL: 16 gauge FINISH: Galvanized INSTALLATION:

- Use all specified fasteners. See General Notes.
- · Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- See alternate installation for applications using the HTU26 on a 2x4 carrying member or HTU28 or HTU210 on a 2x6 carrying member for additional uplift capacity.

OPTIONS: • See Hanger Options on pages 181-183 for skew options.

CODES: See page 12 for Code Reference Key Chart.

HGUQ Multi-Ply Girder Truss Hangers

HGUQ hangers provide similar capacities as HGUS double shear hangers, but they use Simpson Strong-Tie® Strong-Drive® screws (SDS) instead of nails for faster and easier installation. In addition, the SDS screws help transfer the load between the plies of the supporting girder when they penetrate all plies.

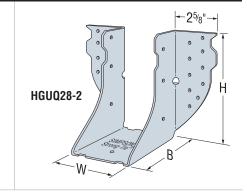

MATERIAL: 12 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- · Simpson Strong-Tie SDS screws supplied.
- Not designed for welded or nailer applications.
- The thickness of the supporting girder must be equal to or greater than the screw length. For applications where the length of the supplied screws exceeds the thickness of the supporting girder, 3" or 4½" screws may be substituted for the longer length screws with no load reduction, or a shim block may used as approved by the Designer.

OPTIONS: These hangers cannot be modified.

CODES: See page 12 for Code Reference Key Chart.

- Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector software or conservatively divide the uplift load by 1.6.

 Wind (CO) is a divasted of a significant of the signif
- 2. Wind (160) is a download rating.
- Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).
- 4. Simpson Strong-Tie Strong-Drive screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2002 Section 8.10 are met (pre-drilling required through the plate using a maximum of %2" bit).
- 5. SDS screws that penetrate all plies of the supporting girder (screws must penetrate a minimum of 1" into the last truss ply) may also be used to transfer the load through all the plies of the supporting girder. When SDS screws do not penetrate all plies of the supporting girder truss, supplemental SDS screws at the hanger locations may be required to transfer the load to the truss plies not penetrated by the face fasteners, as determined by the Designer.
- 6. The supporting girder truss must have adequate thickness to accommodate the screw length, so that the screw does not protrude out the back of the girder. 3" or 4½" long SDS screws may be substituted for the longer SDS screws with no load reduction.
- 7. For installations to LSL, use SDS 1/4"x3" and use the DF/SP table loads.

W/WP/WM Plated Truss Top Flange Hangers

The W and WP hangers offer design flexibility and versatility supporting trusses off of wood or steel. WM hangers are designed for use on standard 8" grouted masonry block wall construction.

MATERIAL: W, WM—12 gauge top flange and stirrup, WP—7 gauge top flange and 12 gauge stirrup

FINISH: Simpson Strong-Tie[®] gray paint; hot-dip galvanized available: specify HDG.

INSTALLATION: • Use all specified fasteners.

- Hangers may be welded to steel headers with 1/8" for W, and 3/16" for WP, by 1½" fillet welds located at each end of the top flange. Weld-on applications produce maximum allowable load listed. Uplift loads do not apply to this application.
- · Hangers can support multi-ply carried members; the individual members must be secured together to work as a single unit before installation into the hanger.
- MID-WALL INSTALLATION: Installed between blocks with duplex nails cast into grout with a minimum of one grouted course above and below the top flange and one #5 vertical rebar minimum 24" long in each adjacent cell.

 • TOP OF WALL INSTALLATION: Install on top of wall to a
- grouted beam with masonry screws.

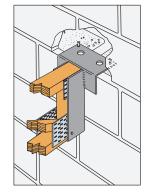

OPTIONS: For 4x2 trusses, specify "alternate nail pattern" (ANP) which relocates the nails to the bottom of the joist. See Hanger Options, pages 181-183 for hanger modifications.

CODES: See page 12 for Code Reference Key Chart.

- 1. WM hangers are limited based on joist bearing capacity for the specific wood species, up to the maximum test value of 4175 lbs. All headers are grouted masonry block.
- 2. Wind (160) is a download rating.
- 3. "Min. H" is the minimum H dimension that may be ordered and desired H dimension should be specified. For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.

 4. NAILS: 16d DPLX = 0.162" dia. x 3½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

THAR/L422 Skewed Truss Hangers

Designed for 4x2 floor trusses and 4x beams, the THAR/L422 has a standard skew of 45°. Straps must be bent for top flange installation. PAN nailing helps eliminate splitting of 4x2 truss bottom chords.

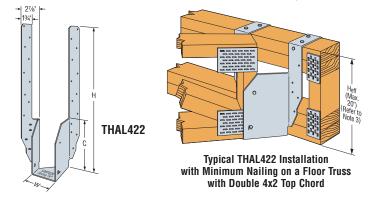

MATERIAL: 16 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners.

See General Notes.

- Straps must be field-formed over the header a minimum of 21/2".
- · Minimum and maximum nailing configurations available - see table for nailing requirements.

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift has been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Roof loads are 125% of floor loads unless limited by other criteria. Floor loads may be adjusted for load durations according to the code provided they do not exceed those in the roof column.
- 3. Where the top of the carried member is flush with the top of the carrying member, H_{eff} is equal to the depth of the carried member. Otherwise, H_{eff} shall be measured
- from the top of the bearing seat to the top of the carrying member. 4. **NAILS:** 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information

THASR/L Adjustable/Skewable Truss Hangers

The THASR/L hangers combine the height adjustability of THA hangers with field skewability, offering maximum flexibility for the installer, and eliminating the need for special orders. Shipped at 45-degrees right or left, the THASR/L hangers can be field skewed down to 221/2 degrees or up to 84 degrees.

MATERIAL: 16 gauge FINISH: Galvanized

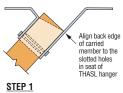

INSTALLATION: • Use all specified fasteners. See General Notes.

- Product is factory skewed to 45 degrees and may be field skewed from 221/2 degrees to 84 degrees.
- For full download, both straps must be field formed over the header.
- For installations where either strap cannot be field-formed over the header, install the strap(s) vertical and install, at a minimum, the required top and face nails into the lowest face nail holes in the strap(s). Loads must be reduced as noted in the table footnotes.

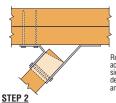

CODES: See page 12 for Code Reference Key Chart.

Double 2x6 Min Typical THASL218 Н Installation (L in model name = Left, R in model name = Right) 2 Top Nails in Field Formed Strap THASL218 3 Face Nails Fill Lowest STEP 4 Vertical Strap Adjust obtuse side Double 2x6 Min of hanger flush with the carrying member. Typical THASL218 Install 10d nails into **Installed** with header on obtuse side One Strap Vertical

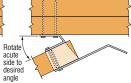

INSTALLATION SEQUENCE:

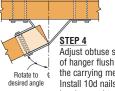

Install carried member into the seat of the hanger. Secure with 6-10dx11/2" nails.

Install 10d nails into header on the acute angle side first.

STEP 3 Adjust acute side of hanger to the desired angle.

- 1. Wind (160) is a download rating
- 2. Minimum heel height shall be 41/2"
- 3. Allowable download for installations with one or both straps installed vertically is 90% of the tabulated download capacities. Allowable uplift capacities are 100% of the tabulated uplift load capacities. The lowest 3 nail holes must be filled in each vertical strap of the THASR/L218, and lowest 4 nail holes in each vertical strap of the THASR/L218-2 and THASR/L418.
- 4. NAILS: 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

Plated Truss Connectors

TJC37 Jack Truss Connector

TJC37 is a versatile connector for jack trusses. Adjustable from

0 to 67.5 degree *(shipped with 67.5 degree bend)*. Nail hole locations allow for easy installation. Minimum nailing option provides faster installation and lower installed cost.

MATERIAL: 16 gauge FINISH: Galvanized

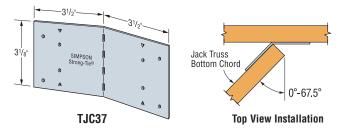

INSTALLATION: • Use all specified fasteners; see General Notes.

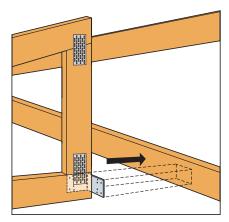

- Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- To reduce the potential for splitting, install the TJC37 with a minimum ¾6" edge distance on the chord members (must be centered on 2x4 chords).
- Position the jack truss on the inside of the bend line with the end of the jack truss flush with the bend line.
- Bend the TJC37 to the desired position (one bend cycle only).
- No bevel cut required.
- Applications involving attachment of TJC37 to the carried truss top chord requires minimum 2x6 carrying member for jack truss pitches up to 7:12, and 2x8 or larger for pitches greater than 7:12. 2x4 carried truss top chord allows for pitches from 0:12 to 3:12.

CODES: See page 12 for Code Reference Key Chart.

- 1. No load duration increase allowed.
- 2. Allowable loads are for upward or downward direction.
- 3. **NAILS:** 8dx1½ = 0.131" dia. x 1½" long. See page 16-17 for other nail sizes and information.

Typical TJC37 Installation

LTHMA Multiple Truss Hangers

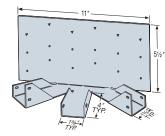

Light capacity hanger designed to carry 2 or 3 trusses in a terminal hip installation. See also the MTHM/MTHM-2 hangers.

MATERIAL: 16 gauge FINISH: Galvanized

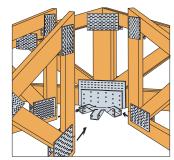

INSTALLATION: • Use all specified fasteners. See General Notes.

- The total load must be symmetrically distributed about the centerline to avoid eccentric loading of the connector.
- Fill round holes for girder trusses with 2x4 bottom chords.
- Fill round and triangle holes for girder trusses with 2x6 bottom chords.

CODES: See page 12 for Code Reference Key Chart.

- Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Hip loads are for each hip.
- Load distribution is 45% for each hip and 10% for jack. Other hip/jack load distributions are allowed if the sum of all three carried members does not exceed the total load and the hip members are equally loaded.
- 4. Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).
- 5. NAILS: 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

THJU Truss Hip/Jack Hanger

The THJU hip/jack hanger offers the most flexibility and ease of installation without sacrificing performance. The U-shaped hanger works for right and left hand hips and can be ordered to fit a range of hip skews (up to 65 degrees) as well as various single and 2-ply hip/jack combinations. Also can be installed before or after the hip and jack.

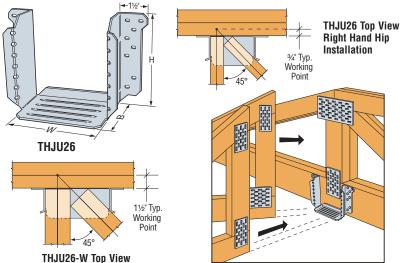

THJU26 is sized for the standard hip/jack combination with a 45-degree left or right-hand hip. The wide seat of THJU26-W accommodates a 2-ply hip and 2-ply jack combination with a 45 degree maximum hip skew, or a standard single-ply hip/jack configuration with a maximum 65-degree hip skew. Intermediate seat widths are available for other hip/jack or hip/hip combinations.

MATERIAL: 12 gauge FINISH: Galvanized INSTALLATION: • Use all specified fasteners.

See General Notes.

OPTIONS: Other seat widths available. See Hanger Options on pages 181-183 for more information.

CODES: See page 12 for Code Reference Key Chart.

- 1. Tabulated loads are the total allowable loads of the hip and jack members combined; 65%-85% of the total load shall be distributed to the hip member, and the remaining percentage of total load shall be distributed to the jack. The combined hip and jack load may not exceed the published total load.
- 2. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed.
- 3. With single 2x carrying members use 10dx1½" nails and use 100% of the table value.
- 4. For single 2x jacks, 10dx1½" nails may be substituted for the specified 10d commons with no reduction in load
- 5. Truss chord cross-grain tension may limit allowable loads.

Double

6. **NAILS:** 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

LTHJ Truss Hip/Jack Hanger

Single piece, non-welded truss hip/jack connector with a standard hip skew of 45-degrees left or right. See also THJA26, LTHJA26, and THJU26 for hip/jack hangers that accommodate both right and left hand hips and can be installed after the hip and jack.

MATERIAL: 18 gauge FINISH: Galvanized; also available in ZMAX® coating. INSTALLATION: • Use all specified fasteners. See General Notes.

- . The two 10d common nails into the jack must be driven at an angle through the side plate slot and jack, and into the carrying member; see HUS for double shear nailing details. The end of the jack cannot be more than 1/8" from the back plate to meet required nail penetration.
- Shall be attached to a minimum 2-ply girder truss to allow for required minimum nail penetration. See footnote 5.

TO ORDER: Specify LTHJL for left 45° skewed hip truss and LTHJR for right 45° skewed hip truss.

OPTIONS: Available in hip slopes up to 45° and/or skews left or right from 46° to 67°. See Hanger Options, pages 181-183.

CODES: See page 12 for Code Reference Key Chart.

- 1. Tabulated hip and jack allowable loads assume that 75% of the total load is distributed to the hip and 25% to the jack. It is permitted to distribute 65% to 85% of the tabulated total load to the hip, and the remaining percentage of total load to the jack. The combined hip and jack load may not exceed the published Total Load
- 2. Uplift loads include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 3. Wind (160) is a download rating.

- Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).
- 5. Loads are based on a minimum 2-ply 2x carrying member. For single 2x carrying members, use 10dx1½" nails and use 0.82 of the table value.
- 6. **NAILS:** 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

SIMPSON Strong-Tie

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The LTHJA26 is a lighter capacity version of the THJA26 and offers the lowest cost alternative for light hip/jack load applications.

MATERIAL: 18 gauge FINISH: Galvanized

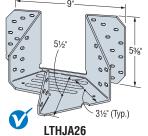

INSTALLATION: • Use all specified fasteners. See General Notes.

- Shall be attached to a double girder truss to allow for required minimum nail penetration. See footnote 3.
- 10dx11/2" nails must be installed into bottom of hip members through bottom of hanger seat for table loads.

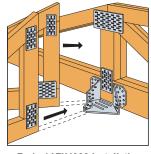

OPTIONS: These hangers can not be modified.

CODES: See page 12 for Code Reference Key Chart.

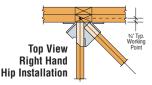

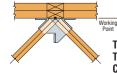

Typical LTHJA26 Installation

- 1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Wind (160) is a download rating.

Plated Truss Connectors

- Loads shown are based on a minimum 2-2x6 carrying member. For single 2x carrying members (min. 2x6), use 10dx1½" nails and use 0.67 of the table value. For 2-2x4 carrying members, multiply the download by 0.50.
- 4. Tabulated hip and jack allowable loads assume that 75% of the total load is distributed to the hip and 25% to the jack. It is permitted to distribute 65% to 85% of the tabulated total load to the hip, and the remaining percentage of total load to the jack. The combined hip and jack load may not exceed the published Total Load.
- 5. Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).
- 6. **NAILS:** 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

THJA26 Truss Hip/Jack Hangers

The versatile THJA26 can accommodate right or left hand hips (at 45-degree skews), and can be installed before or after the hip and jack. Can also be used for double (terminal) hips.

MATERIAL: 14 gauge FINISH: Galvanized

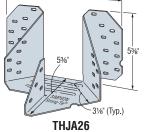

INSTALLATION: • Use all specified fasteners. See General Notes.

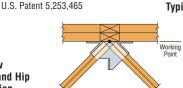

- All multiple members must be fastened together to act as a single unit.
- Shall be attached to a double girder truss to allow for required minimum nail penetration. See footnote 3.

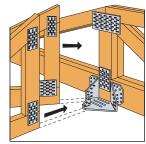

OPTIONS: These hangers cannot be modified. CODES: See page 12 for Code Reference Key Chart.

MTHM/MTHM-2 Multiple Truss Hangers

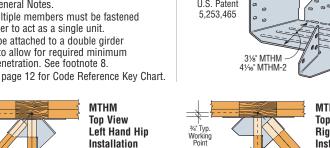

Strong-Tie

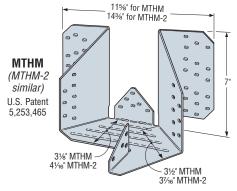

Medium to high load capacity hangers designed to carry 2 or 3 trusses. Accommodates right or left hand hips (at 45-degree skews) and can be used for terminal hips with or without the center common jack. The MTHM-2 accommodates 2-ply hips or jacks.

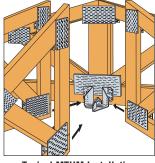

MATERIAL: 12 gauge FINISH: Galvanized INSTALLATION: • Use all specified fasteners. See General Notes.

- All multiple members must be fastened together to act as a single unit.
- · Shall be attached to a double girder truss to allow for required minimum nail penetration. See footnote 8.

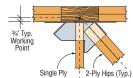

CODES: See page 12 for Code Reference Key Chart.

- 1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Roof (125/160) is a download rating.
- 3. Tabulated hip and jack allowable loads assume that 75% of the total load is distributed to the hip and 25% to the jack. It is permitted to distribute 65% to 85% of the tabulated total load to the hip, and the remaining percentage of total load to the jack. The combined hip and jack load may not exceed the published Total Load.
- 4. For terminal hips divide the total allowable load by 2 to determine the allowable load for each hip.
- Hip loads are for each hip.
- 6. Load distribution is 40% of total load for each hip and 25% for the jack. Other hip/jack load distributions are allowed if the sum of all three carried members does not exceed the total load and the hip members are equally loaded.
- 7. Truss chord cross-grain tension may limit allowable loads. Refer to technical bulletins T-ANSITPISPF, T-ANSITPISP and T-ANSITPIDF for allowable loads that consider ANSI/TPI 1-2007 wood member design criteria (see page 191 for details).
- 8. With single 2x carrying members, use 10dx1½" nails with 0.67 of the table values.
- 9. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

MSCPT Multiple Truss Hangers

The MSCPT is a high capacity, top flange welded hanger designed to carry 2 or 3 trusses in a terminal hip installation. The top flange is notched at the center to accommodate vertical and

MATERIAL: Top flange-3 gauge; stirrup-11 gauge (MSCPT2, MSCPT2N), 7 gauge (MSCPT2-2, MSCPT2-2N)

FINISH: Simpson Strong-Tie® gray paint

diagonal web members in the girder truss.

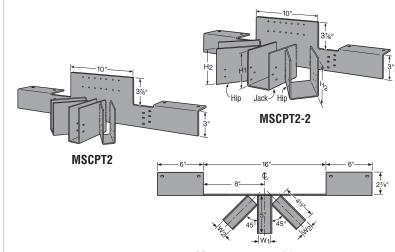

INSTALLATION: • Use all specified fasteners. See General Notes.

- The total load must be evenly distributed about the centerline to avoid eccentric loading.
- · All multiple members must be fastened together to act as a single unit.
- Minimum vertical carrying member sizes are 2x6 for MSCPT2 and MSCPT2N, and 2x8 for MSCPT2-2 and MSCPT2-2N.
- Minimum carrying member bottom chord is a 2-ply 2x6.

OPTIONS: • H₁ and H₂ may be increased for alignment with larger bottom chords.

- Hip stirrups can be skewed from 25° to 45°.
- The W₁ and W₂ of the MSCPT2 may be increased up to 37/16", provided the stirrups' configuration remains symmetrical.

CODES: See page 12 for Code Reference Key Chart.

Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

- Simpson Strong-Tie SDS screws minimum penetration is 23/4", minimum end distance is 21/2" and minimum edge distance is 5/8" for full load values.
- 3. Lag screws will not achieve table loads.
- 4. Simpson Strong-Tie® Strong-Drive® screws (SDS) are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 8.9.2 are met (pre-drilling required through the plate using a maximum of 5/32" bit).

THGQ/THGQH Truss Girder Hangers CHIERED

SIMPSON Strong-Tie

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

A lower cost alternative to bolted hangers, the THGQ and THGQH hangers for multi-ply girder trusses use Simpson Strong-Tie® Strong-Drive® screws (SDS) to provide high load capacities and easier installation compared to bolts. The SDS screws help transfer the load between the plies of the supporting girder when they penetrate all plies.

THGQ and THGQH models offer minimum and optional maximum fastener quantities to accommodate varying design needs. Allowable loads for various girder web member sizes provide additional installation options.

MATERIAL: THGQ—7 gauge, THGQH—3 gauge FINISH: THGQ—Galvanized, THGQH—Simpson Strong-Tie® gray paint INSTALLATION: • Use all specified fasteners. See General Notes.

- · Can be installed filling round holes only, or filling round and triangle holes for maximum values.
- SDS screws supplied for all round and triangle holes. Installation may not require use of all SDS screws.
- · All multiple members must be fastened together to act as a single unit.
- The thickness of the supporting girder must be equal to or greater than the screw length. For applications where the length of the supplied screws exceeds the thickness of the supporting girder, 3" or 4½" screws may be substituted for the longer length screws with no load reduction, or a shim block may be used as approved by the Designer.
- Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref ANSI/TPI 1-2007 Section 7.5.3.5).

OPTIONS: THGQH hangers may be skewed 45 degrees, see Hanger Options on pages 181-183. CODES: See page 12 for Code Reference Key Chart.

Allowable uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern. Connector must be installed centered on girder vertical webs.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

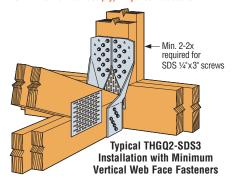

- Simpson Strong-Tie Strong-Drive screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 8.9.2 are met (pre-drilling required through the plate using a maximum of 5/32" bit).
- SDS screws that penetrate all plies of the supporting girder (screws must penetrate a minimum of 1" into the last truss ply) may also be used to

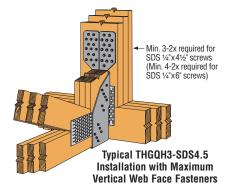

transfer the load through all the plies of the supporting girder. When SDS screws do not penetrate all plies of the supporting girder truss, supplemental SDS screws at the hanger locations may be required to transfer the load to the truss plies not penetrated by the face

fasteners, as determined by the Designer.

The supporting girder truss must have adequate thickness to accommodate the screw length, so that the screw does not protrude out the back of the girder. 3" or 4½" long SDS screws may be substituted for the longer SDS screws with no load reduction.

6. For installations to LSL, use SDS ½"x3" and use the DF/SP table loads.

THGB/THGBH/THGW Truss Girder Hangers

High capacity, welded hangers for multi-ply girder trusses. The THGB series offers optional installation with Simpson Strong-Tie® Strong-Drive® screws (SDS), and the bolted THGBH and THGW hangers offer higher design loads. For a lower cost alternative that uses SDS screws instead of bolts and offers high load capacities, see the THGQ/THGQH series.

MATERIAL: 3 gauge

FINISH: Simpson Strong-Tie® gray paint INSTALLATION:

- VSTALLATION:Use all specified fasteners.
 - See General Notes.

 All multiple members must be fastened together to act as a
 - single unit.

 Maximum 117/8" bottom chord in the carrying member to allow for the minimum bolt end distance.
 - See page 20 for SDS screws.
 - Bolts must be installed symmetrically when using less than 8 bolts on the 8-bolt backplate.
 - Girders must be adequately laterally braced to prevent excessive displacement due to secondary torsional stresses (Ref ANSI/TPI 1-2007 Section 7.5.3.5).

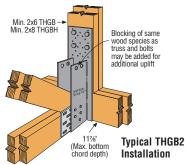

OPTIONS: • Available in widths for 2-ply, 3-ply, and 4-ply LVL members; refer to flier F-THGBV (see page 191 for details).

 See Hanger Options, pages 181-183 for THGB/THGBH skew options.

CODES: See page 12 for Code Reference Key Chart.

- Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern. A 2-ply minimum truss is required. When using 10-10d nails only for carried member, uplift is 1960 lbs. for Doug-Fir/So. Pine and 1625 lbs. for Spruce-Pine-Fir.
- 2. Simpson Strong-Tie SDS 1/4"x3" screw must have a minimum 2-ply member.
- 3. Loads for THGW models are based on end grain bearing.
- 4. Minimum fasteners 10-10d will achieve the down loads and the corresponding uplift (see footnote 1). To achieve maximum uplift, install nails and bolts listed in the table.
- 5. Wind (160) is a download rating.
- To achieve published loads, machine bolts (MB) into the girder truss shall be installed with the nut on the opposite side of the hanger with a standard cut washer (except THGW's).
- 7. **NAILS:** 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

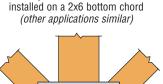

ALTERNATE INSTALLATIONS

SIMPSON Strong-Tie

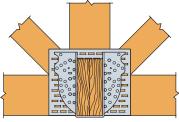

- Block(s) should be of similar size/grade as the truss member to which it is attached. Blocking should be designed to act as one unit with the truss members.
- Block(s) should be of sufficient size to accept all carried/carrying member nails, and develop full seat bearing as specified in Simpson Strong-Tie publications.
- Truss Designer is to confirm blocking size/grade, fasteners required and application.
- Fasteners used to attach the additional blocking should be independent of the truss hanger fasteners.

Use of Wood Blocking to Achieve the Full Design Load Value of a Face Mount Hanger Attached to a Single Ply Carrying (Girder) Member. (Block designed by Engineer of Record or Truss Designer)

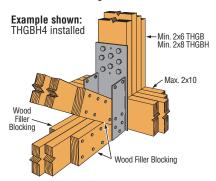

Example shown: HGUS210-2

Connection Design to Achieve Specified Nailing of a Face Mount Hanger at a Panel Point.

Nails located in joints formed by the intersection of wood members or with edge or end distances less than suggested by NDS have no load resistance. The hanger allowable load value shall be reduced by the nail shear value for each header nail less than the specified quantity. Connection shall be approved by the Truss Designer.

Use of Wood Filler Blocking for Carried Member Width Less than Hanger Width. (Block designed by Designer or Truss Designer)

MULTI-PLY WOOD TRUSS APPLICATIONS

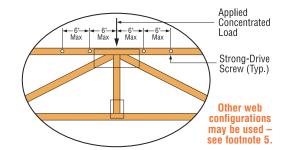

TWO-PLY 4X2 FLOOR TRUSSES

The use of Simpson Strong-Tie® Strong-Drive® screws (SDS) insures that loads are adequately supported by both trusses. (Testing has shown that most currently available light gauge steel connectors do not uniformly distribute applied loads to both trusses.) In addition differential deflection between the two trusses is reduced.

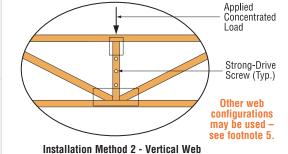

- 1. Screw spacing shall not exceed 24" o.c. and shall not be less than 4" o.c. A minimum end distance of 3" shall be provided at all truss members.
- 2. Gap between the trusses shall not exceed 1/8".
- 3. Floor sheathing shall be screwed (or nailed) to each truss top chord. (Fastener spacing per the applicable Code requirements, or 12" o.c. max.)
- 4. Strong-Drive screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 8.9.2 are met (pre-drilling required through the plate using a maximum of 5/32" bit).
- 5. The Truss Designer shall ensure that each truss is designed for the appropriate load(s) considering the location of the applied load(s) and the location of the Strong-Drive screws.
- 6. The Truss Designer shall design all trusses and the truss system to meet all Code and ANSI-TPI requirements.
- 7. Individual screw locations may be adjusted up to 3" to avoid conflicts with
- other hardware or to avoid lumber defects. 8. Strong-Drive screws shall not be installed in areas where lumber wane exceeds 1/4".
- 9. All concentrated loads were assumed to be applied at truss panel points.
- 10. Installation in truss bottom chords is not recommended but is acceptable if approved by the Truss Designer.

For more information, refer to technical bulletin T-SDSCREWAPPS (see page 191 for details).

Also see Connector Selector Software page 194.

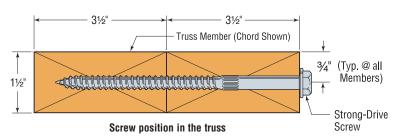

Installation Method 1 - Top Chord

	Allowable S	Shear Loads
Model	DF/SP	SPF
No.	(G = 0.50 min)	(G = 0.42)
	Floor (100)	Floor (100)
SDS25600	280	200

- 1. Allowable loads are based on a C_D = 1.00. Increases are allowed for other durations per code to a maximum $C_D = 1.60$. No further increase allowed.
- 2. Method 1—To be considered effective all Strong-Drive screws shall be installed within 12" of the applied concentrated load.
- 3. Method 1 and Method 2 screws can be combined as required to transfer half of the applied load to the supporting truss.
- 4. For uniform top chord loads, space Strong-Drive screws as required to transfer half of the applied load to the supporting truss.
- 5. Web configurations other than those shown above may be used as allowed by the Truss Designer.

MULTI-PLY WOOD TRUSS APPLICATIONS

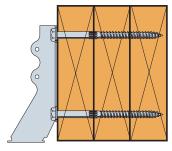

STRONG-DRIVE® SCREWS (SDS) FOR GIRDER TRUSSES

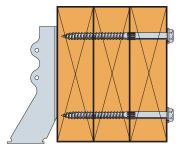

- Install Simpson Strong-Tie® Strong-Drive screws (SDS) a minimum of 1 inch into the last truss ply, with a maximum gap of 1/8" allowed between each truss ply.
- 2. Screw spacing shall not exceed 24" o.c.
- Hanger load spacing on the multi-ply truss shall not exceed 24" o.c.
- 4. The Truss Designer shall ensure that adequate lateral bracing is provided to prevent displacement of the truss and the truss bottom chord due to the torsion created by the structural members framing into the side of the multi-ply girder truss.
- Strong-Drive Screws may be installed with the heads in either the loaded or unloaded ply (see Allowable Shear Loads table).
 For unloaded ply applications, hanger face nails shall be a minimum of 3" long.
- Strong-Drive screws are permitted to be installed through metal truss plates as approved by the Truss Designer, provided the requirements of ANSI/TPI 1-2007 Section 8.9.2 are met (pre-drilling required through the plate using a maximum of %2" bit).
- Use 1 row of SDS's in 2x4 members, 2 rows in 2x6 and 2x8 members, 3 rows in 2x10 members. Rows should be staggered.
- Individual screw locations may be adjusted up to ½ of the required screw spacing to avoid conflicts with other hardware or to avoid lumber defects.
- These products feature additional corrosion protection.

- 1. Where noted allowable loads are based on ESR-2236.
- The Truss Designer shall apply all adjustment factors required per the NDS.
- Loads are based on 1½" thick wood side members and apply to 3 and 4 ply 2x wood truss applications. (Side and main members of same wood species.) Contact Simpson Strong-Tie for other applications.
- 4. LSL applications are limited to interior-dry use only.

For more information, refer to technical bulletin T-SDSCREWAPPS (see page 191 for details). Also see Connector Selector Software page 194.

SDS Installation in Loaded Ply

SDS Installation in Unloaded Ply

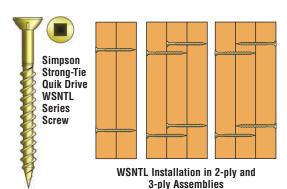

Simpson Strong-Tie Strong-Drive Screw

U.S. Patent 6,109,850 / 5,897,280 / 5,044,853

QUIK DRIVE® AUTO-FEED SYSTEM FOR 2-PLY AND 3-PLY GIRDERS

Simpson Strong-Tie Quik Drive WSNTL wood screws are a safe, fast and reliable method for attaching multi-ply trusses. The QD WSNTL screws,like their SDS counterparts, virtually eliminate ply separation during handling.

See the Quik Drive Auto-Feed Screw Driving Systems catalog (form C-QD) for more information. (See page 191 for details)

TSF Truss Spacer

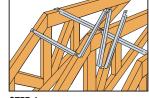

The TSF is a fast and accurate method for spacing trusses that eliminates layout marking of top plates and can be left in place under the sheathing. Accuracy is improved, spacing errors are minimized, and it is easy to use.

MATERIAL: 24 gauge FINISH: Galvanized INSTALLATION: • See Installation Sequence below.

 TSF Truss Spacers do not provide bracing of any kind and are not structural members. The TSF is for spacing only.
 Refer to instructions from architect, engineer, truss manufacturer or other for bracing and installation information.

CODES: See page 12 for Code Reference Key Chart.

Madal		Dimensio	ns	Codo
Model No.	w	O.C. Spacing	Total Length	Code Ref.
TSF2-16	1½	16	8'	180
TSF2-24	1½	24	10'	100

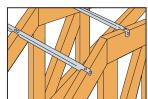

STEP 1 Nail starting notch to first member.

TSF

STEP 2
As each successive member is positioned, unfold TSF to next notch. The notch teeth grip member and align it for nailing.

STEP 3 If spacer does not align with end truss, break spacer off at notch. Then, hammer spacer flat, fold it under and nail.

The Simpson Strong-Tie® Truss Spacer Bracer is an innovative lateral bracing product that meets or exceeds the prescriptive bracing recommendations of TPI/WTCA BCSI, with features not found elsewhere in the market.

FEATURES: • The TSB "captures" the on-center spacing of the trusses, allowing quicker and safer installations.

- · Meets or exceeds the prescriptive tension and compression load recommendations of TPI/WTCA BCSI-06.
- · Can be used as Permanent Lateral Restraint and as Temporary Erection Lateral Restraint.
- Has a low profile that can be sheathed over when used as erection restraint, eliminating the need to remove prior to sheathing.

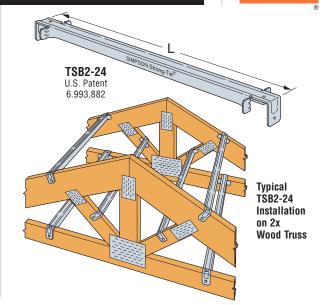

MATERIAL: 22 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners; see General Notes.

CODES: See page 12 for Code Reference Key Chart.

N/II - I	F4			le Loads¹		0 - 4 -

TSB2-24	4-10dx1½	25½	540	425	465	365	100

- 1. No load duration increase allowed.
- 2. NAILS: $10dx1\frac{1}{2} = 0.148$ " dia. $x1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information

TBD22 Diagonal Brace

NEW! The TBD22 diagonal truss brace offers a time-saving substitute for 2x4 diagonal bracing that helps meet the recommendations of TPI/WTCA BCSI. The TBD travels in a box like a flat strap, and is

of TPI/WTCA BCSI. The TBD travels in a box like a flat strap, and is formed into an A-shape as it is pulled from the carton to provide rigidity and prevent sagging between trusses during installation. As it is fastened to the trusses the brace flattens, allowing sheathing to be installed right over it and saving the time typically needed to remove 2x4 bracing.

When installed on the top and bottom chords as well as the web planes, the TBD captures the lateral construction and wind forces delivered by the TSB truss spacer/bracer and transfers it diagonally in tension to the edge of the braced-truss system. When used in conjunction with the TSB, the TBD22 meets or exceeds the the recommendations set forth by the TPI/WTCA BCSI.

FFATURES: • Helps meet prescriptive temporary bracing

FEATURES: • Helps meet prescriptive temporary bracing recommendations of the TPI/WTCA BCSI.

- Rigid A-shape design virtually eliminates sagging between trusses spaced 16"-24" on center.
- · Can be sheathed over after installation, no need to remove bracing.
- · Dimpled nailing grid allows installation with standard pneumatic fasteners.

160' of bracing in an easy-to-handle carton. **RIAL:** 22 gauge **FINISH**: Galvanized

MATERIAL: 22 gauge

INSTALLATION: • Use all specified fasteners; see General Notes.

• Strap does not have holes for fasteners. Nails shall be installed in the dimpled areas and placed to maintain a minimum of ¼" strap edge distance and a minimum of ½" center to center distance. Nails should be installed in the center of the lumber narrow face and with a minimum edge distance of 1" on the lumber wide face.

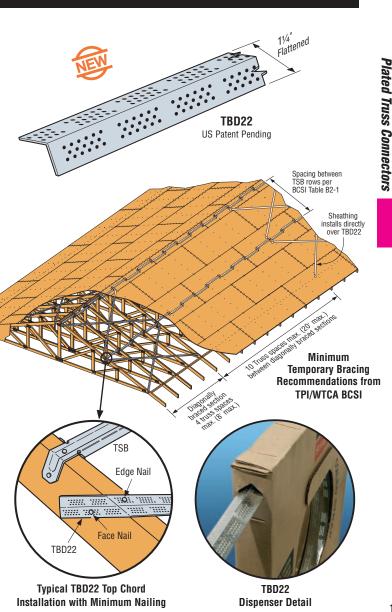

- TBD22 straps span diagonally at approximately 45°
- · Strap shall not be slack, but tight and ready to engage
- To resist construction forces, diagonal X-bracing is required at each end and every 10 truss spaces (20' max).
 Refer to WTCA/TPI BCSI for additional information.
- At the end of the TBD braces trusses shall be laterally braced to resist out of plane forces.
 Bracing locations shown in the drawing are recommendations for temporary bracing only. Installation of TBD braces for permanent lateral bracing shall be per the Building Designer.

 CODES: See page 12 for Code Reference Key Chart.

	Model	Fastener	s	Allov Tension	Code	
	No.	Strap Ends	Intermediate Trusses	DF/SP	SPF/HF	Ref.

Ļ	TBD22 ² (Min)	1-10dx1½ in face and 1-10dx1½ in edge	1-10dx1½	430	390	170
Ļ	TBD22 (Max)	2-10dx1½ in face and 1-10dx1½ in edge	1-10dx1½	565	520	170

- 1. Allowable loads have been increased for construction and wind loading with no further increase allowed.

 Minimum nailing meets or exceeds the temporary bracing recommendations
- of TPI/WTCA BCSI.
- 3. **NAILS:** $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

TBE Truss Bearing Enhancers

The TBE transfers load from the truss or girder to plates for bearing-limited conditions, and provides exceptional uplift capacity. Replaces nail-on scabs that provide lower load transfer, or in some cases, an additional ply when needed for bearing. One size works with any number of girder plys.

The table lists allowable loads for TBE4 used on 2x4 and TBE6 used on 2x6 top plates. The table gives the different loads calculated for TBE with and without wood bearing. See Fastener Schedule below and page 135 for Alternate Installation.

MATERIAL: 18 gauge FINISH: Galvanized. See Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

- TBE must be installed in pairs.
- Top plate size is 2x4 for TBE4, 2x6 for TBE6. Use alternate installation for TBE4 and TBE6 on larger plates or pre-sheathed walls. See page 135.

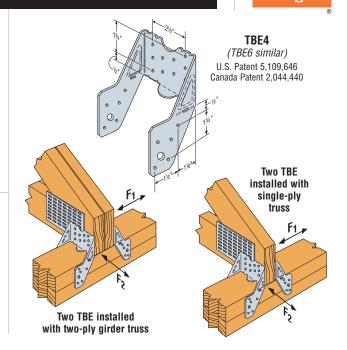

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Loads are for a pair of TBEs.
- 2. When truss chord wood species is different than the wall top plate wood species, choose the tabulated allowable loads based on the species with the lower tabulated download capacity.
- Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 4. Allowable loads are determined only by nail shear calculations or tests of the metal connectors based on the lowest of 0.125" of deflection or the ultimate load with a 3 times factor of safety. The attached wood members must be designed to withstand the loads imposed by the nails.
- 5. Perpendicular to Plate loads are reduced for Alternate Installation.
- 6. Parallel to Plate loads are not reduced for Alternate Installation.
- 7. Equivalent Top Plate Bearing Width is the actual top plate width (TBE4 = $3\frac{1}{2}$ ", TBE6 = $5\frac{1}{2}$ ") plus the enhanced bearing width provided by the TBE.

TBE Truss Bearing Enhancers

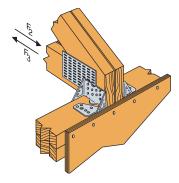

ALTERNATE INSTALLATION

(See illustrations at right)

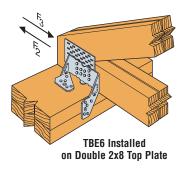

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

	Alternate Installation Allowable Loads ^{5,6} Perpendicular to Plate								
Model No.	DF,	/SP	SPF/HF						
NU.	(16	60)	(160)						
	F ₂	F ₃	F ₂	F ₃					
TBE4	1000	300	860	260					
TBE6	1000	300	000	200					

- 1. Use full table loads for uplift and parallel-to-plate allowable loads.
- 2. Download capacities are 0.80 of table loads.
- 3. See additional footnotes on opposite page.

Pre-sheathed shearwall. Bend tab along slot and nail one leg to top of the plate.

Alternate Installation Allowable Down Loads are 0.80 and Allowable Uplift Loads are 1.0 of the TBE only table loads on page 134.

TC Truss Connectors

The TC truss connector is an ideal connector for scissor trusses and can allow horizontal movement up to 11/4". The TC also attaches plated trusses to top plates or sill plates to resist uplift forces. Typically used on one or both ends of truss as determined by the Designer.

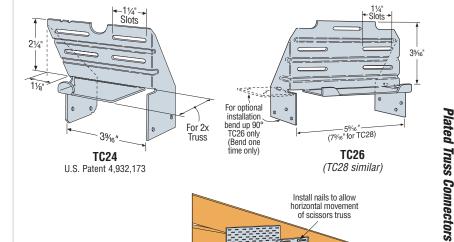

MATERIAL: 16 gauge FINISH: Galvanized INSTALLATION:

- · Use all specified fasteners. See General Notes.
- . Drive 10d nails into the truss at the inside end of the slotted holes (inside end is towards the center of the truss). Do not seat these nails into the truss-allow room under the nail head for movement of the truss with respect to the wall.
- · After installation of roofing materials nails may be required to be fully seated into the truss. (As required by the Designer or Truss Designer.)

Optional TC Installation

• Bend one flange up 90°. Drive specified nails into the top and face of the top plates or install Titen® screws into the top and face of masonry wall. See optional load tables and installation details.

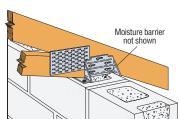

CODES: See page 12 for Code Reference Key Chart.

Typical TC24 Installation

Optional TC26 Installation for Grouted Concrete Block using a Wood Nailer (8", 10", 12" Wall Installation similar)

Optional TC26 Installation for Grouted Concrete Block using Titen Screws

	5-10d	6-3/16x21/4 Titen	_	_	195		

- 1. Loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Grout strength is 2000 psi minimum.
- 3. Nail values based on single 2x truss.
- 4. Optional TC26 installation with 10d nails requires minimum 3" top plate thickness.
- 5. **NAILS:** 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

HTC Heavy Truss Clips

For alignment control between a roof truss and nonbearing walls; the 2½" slot permits vertical truss chord movement when loads are applied.

MATERIAL: 18 gauge FINISH: Galvanized

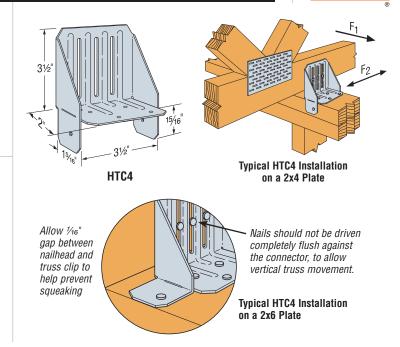

INSTALLATION: • Use all specified fasteners; see General Notes.

- The HTC has a 21/2" slot to accommodate truss movement
- · This connector has high lateral capacity.
- The S/HTC is available for steel truss applications.

CODES: See page 12 for Code Reference Key Chart.

	Dimensions	Faste	eners	Allo		_		
Model No.	Top Plate	Base	Slot	Withou	ıt Gap²	With 13	4" Gap³	Code Ref.
140.	TOP Plate	Dase	SIUL	F ₁	F ₂	F ₁	F ₂	11011
HTC4	2x4 Plate	6-10d	3-10d	390	305	85	280	170
птС4	2x6 Plate	6-10d	3-10d	485	280	155	280	170

- 1. Loads may not be increased for short-term loading.
- Truss or rafter must be bearing on top plate to achieve the allowable loads under "WITHOUT GAP."
- When installed with maximum 11/4" space between rafter or truss and top plate use loads under "WITH 11/4" GAP." Where loads are not required, space is not limited to 11/4"
- 4. NAILS: 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

STC/STCT/DTC Roof Truss Clips

For alignment control between a roof truss and nonbearing walls; the 11/2" slot permits vertical truss chord movement when loads are applied.

MATERIAL: 18 gauge FINISH: Galvanized

Plated Truss Connectors

INSTALLATION: • Use all specified fasteners; see General Notes.

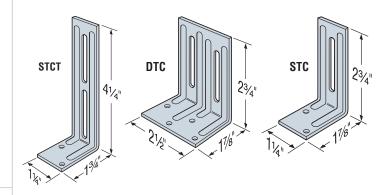

- Use STC or DTC depending on required loads. STC, installed with Drywall Stop (DS), helps prevent fasteners tearing through the ceiling sheetrock (see illustration).
- Use STCT where truss or rafter is separated from the top plate of the nonbearing wall.
- . Install slot nails in the middle of the slot.

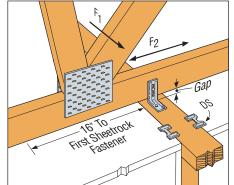

CODES: See page 12 for Code Reference Key Chart.

	Faste	eners							
Model No.	Base	Slot	Without Gap ²		1/4" Max Gap		1⁄4" < Ga	Code Ref.	
	Dase	SIUL	F ₁	F ₂	F ₁	F ₂	F ₁	F ₂	
STC	2-8d	1-8d	85	55	35	35	30	40	
STCT	2-8d	1-8d	_	_	_	_	_	_	170
DTC	4-8d	2-8d	125	210	85	135	55	70	

- 1. Loads may not be increased for short-term loading.
- 2. Truss or rafter must be bearing on top plate to achieve the allowable loads under "WITHOUT GAP."
- 3. Clips are required on both sides of the truss to achieve F₁ loads in both directions (stagger parts to avoid nail interferences).

 4. NAILS: 8d = 0.131" dia. x 2½" long.
- See page 16-17 for other nail sizes and information.

Typical STC Installation with DS

Nails should not be driven completely flush against the connector, to allow vertical truss movement.

SIMPSON

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The VTC2 is a valley truss to common truss connector. VTC2 is installed on top of the roof sheathing. It provides a positive connection and eliminates the costly support wedge underneath the valley truss or valley truss bottom chord bevel cutting. VTC2 is adjustable to slopes between 2:12 to 8:12.

MATERIAL: 18 gauge FINISH: Galvanized

INSTALLATION: • See installation sequence below.

- Use all specified fasteners. See General Notes.
- The dome nail holes assist in installing the common truss fasteners slanted at an angle approximately 55° from the horizontal level line.
- Install two 10dx11/2" nails in one vertical stirrup and three 10dx11/2" nails in the other vertical stirrup to the valley truss bottom chord.
- \bullet For use with 7/16" or 1/2" thick sheathing. Contact Simpson Strong-Tie for loads for different sheathing thicknesses or when attached directly to framing.

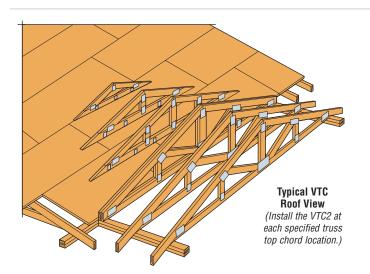

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Wind (160) is a download rating.

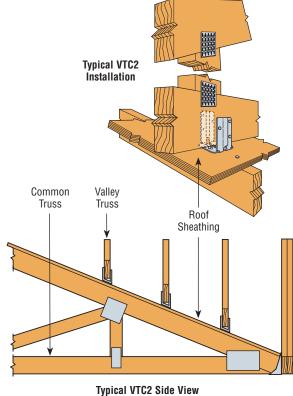

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

3. **NAILS:** 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

U.S. Patent 6,840,020

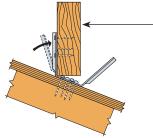

Valley Truss

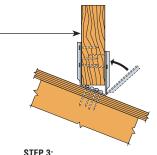

VTC2 INSTALLATION SEQUENCE

STEP 1: Align the centerline of VTC2 with the common truss top chord centerline. Attach through the roof sheathing to the common truss top chord.

STEP 2: Adjust the upslope stirrup vertically and attach to valley truss bottom chord.

STEP 3: Adjust the downslope stirrup vertically and attach to bottom chord. Bend stirrups one time only.

GBC Gable Brace Connector

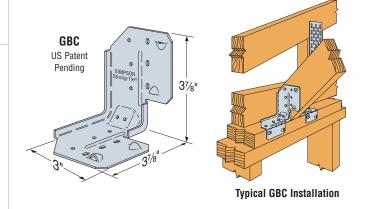

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

The GBC provides improved anchorage of gable bracing to the exterior wall. Installation flexibility for brace angle. GBC has tension and compression capacities.

MATERIAL: 16 gauge FINISH: Galvanized INSTALLATION:

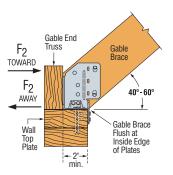

- Use all specified fasteners. See General Notes.
- The GBC must be installed in pairs to achieve full load capacity.

CODES: See page 12 for Code Reference Key Chart.

	p	Faster		DF/SP Allowable Loads (160) Perpendicular to Endwall (F ₂)				SPF/ Perp				
Model	Qty	Conne	ctor	Towar	d GBC	Away fr	om GBC	Toward Anchors		Away from Anchors		Code Ref.

			Plates	40°-45°	46°-60°	40°-45°	46°-60°	40°-45°	46°-60°	40°-45°	46°-60°	
GBC	2	5-8dx1½	7-8d	635	570	425	325	535	480	355	275	I13, F12

- 1. For 134 x 31/2 (or larger) LVL gable brace, the allowable load at 40° to 45° is 635 lbs. towards anchors, 515 lbs. away from anchors.
- 2. Loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 3. Use a minimum 2x4 gable brace. Larger members may be used.
- **NAILS:** 8d = 0.131" dia. x $2\frac{1}{2}$ " long, $8dx1\frac{1}{2} = 0.131$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

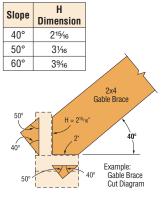

SIMPSON

Strong-Ti

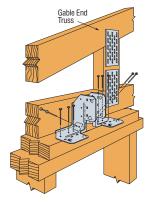

Typical Sloped Installation

GBC INSTALLATION SEQUENCE

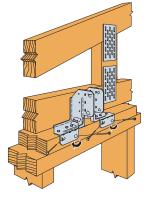

STEP 1

Double angle cut the gable brace to sit flat on the wall double top plate and flush against the gable end truss for 2x4 top plate. The double angle cuts should form a 90° angle on the end of the gable brace.

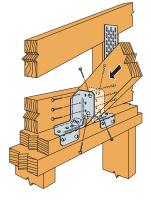

STEP 2

Set each GBC on top of the double top plate so that the bend line slots are flush with the inside edge of the double top plate. Install fasteners into the top of the double top plate.

STEP 3

Bend GBC legs (one time only) over the inside of the double top plate and install fasteners.

STEP 4

Install fasteners into the gable brace.

NOTE: Attach the other end of the gable brace to blocking at the roof diaphragm as directed by the Designer.

TITEN® Screws

Titen screws are 3/16" and 1/4" diameter masonry screws for attaching various components to concrete and masonry. Available in hex and phillips head designs in three colors. Use with appropriately sized Titen drill bits included with each box. CODES: See page 12 for Code Reference Key Chart.

WARNING: Industry studies show that hardened fasteners can experience performance problems in wet or corrosive environments. Accordingly, use this product in dry and noncorrosive environments only or provide a moisture barrier.

Titen Screw Anchors for Concrete

						Allowab	le Loads		
Titen Dia.	Drill Bit Dia.	Embed. Depth	Critical Spacing	Critical Edge Dist.	Cond	crete	CIV	/IU	Code Ref.
(in)	(in)	(in)	(in)	(in)	Tension	Shear	Tension	Shear	ngi.
3/16	5/32	1	21/4	11/8	125	255	110	205	
3/16	5/32	1½	21/4	11/8	305	415	_	_	170

1/4	3/16	1½	3	1½	365	400	_	_	

- 1. Allowable loads may not be increased for short term loading due to wind or seismic forces.
- 2. Concrete shall have a minimum f'c = 2000 psi. CMU is based on installation into face shell of hollow and grout-filled CMU.
- 3. The attached member or element may govern the allowable load. The designer shall verify allowable load.
- 4. Refer to the Simpson Strong-Tie® Anchoring and Fastening Systems for Concrete and Masonry catalog (form C-SAS) for complete information on the Titen screws (see page 191 for details).

WM/WMI/WMU Hangers

See pages 96-105 for sizes, fasteners and load information.

WMs are designed for use on standard 8" grouted masonry block wall construction.

MATERIAL: See tables on pages 70-73, 96-105, 122; WM, WMI, WMU—12 ga. top flange and stirrup FINISH: Simpson Strong-Tie® gray paint; hot-dip galvanized available: specify HDG.

INSTALLATION: • Use all specified fasteners.

- WM-two 16d duplex nails must be installed into the top flange and embedded into the grouted wall. Verify that the grouted wall can take the required fasteners specified in the table.
- MID-WALL INSTALLATION: Installed between blocks with duplex nails cast into grout with a minimum of one grouted course above and below the top flange and one #5 vertical rebar minimum 24" long in each adjacent cell.
- TOP OF WALL INSTALLATION: Install on top of wall to a grouted beam with masonry screws.
- Refer to technical bulletin T-SLOPEJST for information regarding load reductions on selected hangers which can be used without modification to support joists which have shallow slopes ($\leq 3/4:12$) (see page 191 for details).

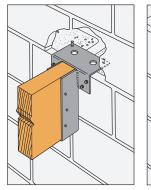

OPTIONS: • See Hanger Options, pages 181-183 for hanger modifications and associated load reductions.

· WMU may not be modified.

HU/HUC/HSUR/L Hangers

HU and HUC products are heavy duty face mount joist hangers made from 14 gauge galvanized steel.

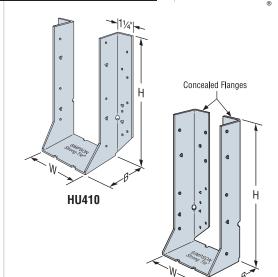

- The HUC is a concealed flange version of the HU. Concealed flange hangers have the header flanges turned in.
- HU is available with header flanges concealed, provided the W dimension is 25/16" or greater, at 100% of the table load. Specify HUC.
- HU is available with one header flange concealed when the W dimension is less than 25%6" at 100% of the table load.
- For allowable loads on HU products not listed in the table request technical bulletin T-HUHUCTTN (see page 191 for details).

MATERIAL: 14 gauge FINISH: Galvanized

INSTALLATION:

- These hangers are attached to grouted CMU walls using ½"x2¾" hex head Titen® screws or for concrete walls using ½"x1¾" hex head Titen screws. Titen screws are not provided.
- Drill the 3/16" diameter hole to the specified embedment depth plus 1/2".
- Alternatively, drill the ¾6" diameter hole to the specified embedment depth and blow it clean using compressed air.
- Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.
- The hangers should be installed such that a minimum end and edge distance of $1\frac{1}{2}$ " is maintained.
- · Not recommended for exposed exterior applications.
- Provide moisture barrier between beam and wall per jurisdictional requirements.

CODES: See page 12 for Code Reference Key Chart.

- 1. Uplift loads have been increased 60% for wind or earthquake loading with no further increase is allowed.
- 2. Minimum concrete strength f'_C shall be 2500 psi. CMU shall have a minimum grout strength of 2500 psi with standard ASTM C90 units and type N or S mortar.
- 3. The HU28 can be ordered skewed 45° and achieve the same loads.
- 4. See page 139 for Titen screw information.
- 5. Noted loads for the HSUR/L shall be 0.8 the table loads for concrete applications.
- 6. Table allowable loads were determined using tested lowest ultimate/3 or fastener calculation values.
- 7. Products shall be installed such that the Titen screws are not exposed to the weather.
- 8. **NAILS:** $16dx2\frac{1}{2} = 0.162$ " dia. x $2\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long,

 $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

HU410 Installed on Masonry Block Sidewall

HUC410 Installed on Masonry Block End Wall

HSUR/L26-2 Installed on Masonry Block Sidewall

LGUM/HGUM High Capacity Beam/Girder Hangers for Concrete/Masonry

High-capacity beam or girder hangers for concrete or masonry applications. Installation is made easier using Simpson Strong-Tie® Strong-Drive® screws (SDS) (provided) into the wood member and Titen HD® anchors (provided) into the masonry.

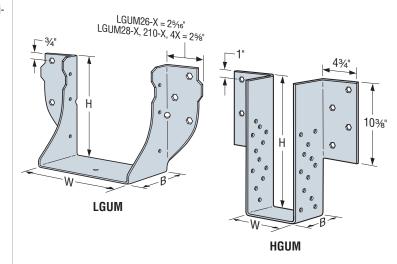

MATERIAL: See table FINISH: Galvanized

INSTALLATION: • Use all specified fasteners (included).

- Attach hanger to a concrete or grouted CMU wall using Titen HD anchors. Note the following:
 - Drill holes using drill bits equal in diameter to the specified Titen HD anchor.
 - Holes shall be drilled ½" deeper than the specified Titen HD length (i.e. 4½" for a 4" long Titen HD anchor)
 - Caution: Oversized holes in the base material will reduce or eliminate the mechanical interlock of the threads with the base material and will reduce the anchor's load capacity.
- Titen HD is not recommended for exposed exterior applications.
- Provide moisture barrier between beam and wall per jurisdictional requirements.

OPTIONS: For HGUM only—Other seat widths available. Order as "X" version.

CODES: See page 12 for Code Reference Key Chart.

- 1. ATR is all threaded rod.
- 2. Minimum concrete strength f' $_{\rm C}$ shall be 2500 psi. CMU shall have a minimum grout strength of 2500 psi with standard ASTM C90 units and type N or S mortar.
- 3. Uplift loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 4. Loads are based on installation using Simpson Strong-Tie® ET Epoxy-Tie® adhesive 63/4" minimum embedment required. All thread rods to be 3/4" diameter, grade A307 or better. Refer to the Simpson Strong-Tie® Anchoring and Fastening
- Systems for Concrete and Masonry catalog (form C-SAS see page 191 for details).
- 5. MBHA hangers with height of 71/4" require a 31/2" minimum embedment of the face bolt using ET Epoxy-Tie adhesive. All thread rods to be 3/4" diameter, grade A307 or better.
- 6. Additional anchorage products to be designed by others. Uplift loads are for Southern Pine. For Doug Fir use 3515 lbs.
- Table allowable loads were determined using test ultimate/3 or fastener calculation values.
- **NAILS:** 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

ITTM Engineered Wood Products Hangers

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

ITTM masonry-to-wood connectors can be directly embedded into a grouted block wall. It can also be installed on top of a masonry or concrete wall using Titen® screws.

MATERIAL: 12 gauge top flange and 18 gauge stirrup

FINISH: Galvanized

Masonry Connectors

INSTALLATION: • Use all specified fasteners.

- ITTM installed into grouted block wall: embed into block with a minimum of one course of grouted block above and one course below the top flange. No Titen screws required.
- ITTM installed on concrete masonry wall: install 1/4"x13/4" hex head Titen screws through preformed holes on the hanger.

OPTIONS: • Options not available.

CODES: See page 12 for Code Reference Key Chart.

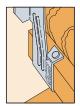

ITTM INSTALLATION

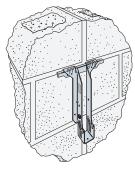

Bend the tab with a hammer.

Hammer 10dx1½ nail in at approximately 45°.

The tab is now correctly installed.

Typical Mid-Wall ITTM Installed into Concrete Block (No Titens required)

U.S. Patent 5,555,694

Typical Top-of-Wall ITTM Installed on a Grouted Block with Titens

- 1. Uplift loads are based on DF/SP lumber and have been increased 60% for wind or earthquake loading with no further increase allowed. For normal loading applications such as cantilever construction refer to Simpson Strong-Tie® Connector Selector™software or conservatively divide the uplift load by 1.6. For SPF use 0.86 x DF/SP uplift load.
- 2. Titen masonry screws are 1/4" x13/4".
- 3. Minimum f'_{m} = 1500 psi and f'_{C} = 2500 psi.
- 4. Mid-wall installation requires minimum of one grouted course above and below the hanger.
- 5. Products shall be installed such that the Titen screws are not exposed to the weather. 6. NAILS: $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

The Hurricane Tie series features various configurations

The H10S provides a high capacity connection from truss/rafter to wall. Also suitable for wood-to-wood applications (see page 156).

of wind and seismic ties for trusses and rafters.

The HM9 is designed to retrofit roof truss/rafters for block construction. The HM9 hurricane tie provides high uplift and lateral capacity using Simpson Strong-Tie® concrete fasteners.

The presloped 5:12 seat of the H16 provides for a tight fit and reduced deflection. The strap length provides for various truss heights up to a maximum of 131/2". Minimum heel height for H16 series is 4".

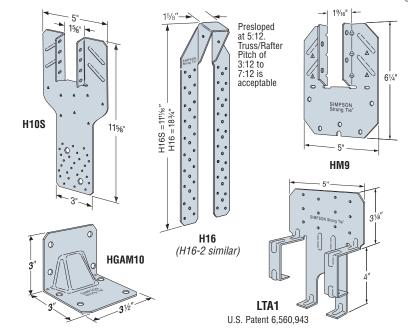

The LTA1 develops high uplift and lateral loads at a minimum heel height. The side tabs act as a locator in the block and the four embedded hooks allow for higher loads with a relatively shallow embedment.

MATERIAL: See table.

FINISH: Galvanized; see Corrosion Information, page 10-11. INSTALLATION: • Use all specified fasteners. See General Notes.

- Connectors attached using hex head Titen® screws.
- · Attach to grouted concrete block with a minimum one #5 rebar horizontal in the course.
- · Hurricane Ties do not replace solid blocking.

CODES: See page 12 for Code Reference Key Chart.

- 1. Loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- Allowable loads are for one anchor. A minimum rafter thickness of 2½" must be used when framing anchors are installed on each side of the joist and on the same side of the plate.
- 3. The HM9KT and HGAM10KTA are kits packaged with Simpson Strong-Tie® Strong-Drive® screws (SDS) and 21/4" and 23/4" Titen® screws respectively. (13/4" Titen screws for concrete installations sold separately.)
- 4. Minimum edge distance 11/2" using Titen screws.
- 5. See page 139 for Titen screw information.
- 6. Table allowable loads were determined using test ultimate/3 or fastener calculation values.
- Products shall be installed such that the Titen screws and Titen HD® anchors are not exposed to the weather.
- away from the connector.

META/HETA/HHETA/HETAL/DETAL/TSS Embedded Truss Anchors and Truss Seat Snap-In

SIMPSON
Strong-Tie

The embedded truss anchor series provides an engineered method to properly attach roof trusses to concrete and masonry walls. The products are designed with staggered nail patterns for greater uplift resistance. Information regarding the use of two anchors on single- and multi-ply trusses is included.

The TSS, a companion product of the META, provides a moisture barrier between the concrete and truss. The preassembled unit is riveted with no height adjustment.

NEW! The DETAL20 is a high capacity embedded truss anchor for attachment of single-ply trusses to concrete and masonry walls. It combines dual embedded anchors with a structural moisture-barrier seat that is partially embedded in the concrete or grout. This seat serves to protect the truss and also provides additional lateral and uplift capacity. The embedded anchors are pre-attached to the moisture barrier through slots that allow for a slight amount of adjustability, providing flexibility during installation to avoid rebar. The moisture-barrier seat includes tabs at each end for optional attachment to the form board in concrete tie-beam applications.

MATERIAL: HHETA-14 gauge; HETA-16 gauge; HETAL-strap 16 gauge, truss seat 18 gauge; META-18 gauge; TSS-22 gauge; DETAL-16 gauge (Barrier-18 gauge)

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

- The META, HETA and HHETA are embedded 4" into a concrete beam or grouted block wall; HETAL is embedded 51/16"; DETAL is embedded 41/2".
- The DETAL20 is installed centered and flush on top of an 8" masonry bond beam or concrete tie beam.
 The moisture barrier seat bears on masonry face shell or concrete tie beam form boards; the two flanges embed into grout or concrete. The two embedded anchors shall be installed vertically into grout or concrete.
- The TSS moisture barrier may be preattached to the truss using 6d commons.
- A shim is required between the truss and the embedded truss anchor when there is a space of ½" to 1½".

 In double embedded anchor installations, do not install fasteners where the straps overlap when wrapped over the truss heel.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Moisture barrier not shown (Typ.)

#5 Rebai

Straps may be installed straight or wrapped over to achieve listed loads

1. Loads include a 60% load duration increase on the fasteners for wind or seismic loading.

Minimum f'_C = 2500 psi. Minimum f'_M = 1500 psi.
 For simultaneous loads in more than one direction, the connector must be evaluated as described in Note e, page 14 under Instructions to the Designer.

4. Five nails must be installed into the truss seat of the HETAL. 5. Parallel-to-wall load towards face of HETAL is 1975 lbs.

- 6. It is acceptable to use a reduced number of fasteners provided that there is a reduction in uplift load capacity. See example on page 151. Lateral loads do not apply when fewer than 7 fasteners are used with the HETA and HHETA anchors or less than 6-16d or 7-10dx1½ fasteners are used with the META anchor.
- The HHETA allowable F1 load can be increased to 435 lbs. if the strap is wrapped over the truss and a minimum of 12 nails are installed.
- Minimum spacing for multiple anchor installation is 2 times the embedment depth for full load. See Double Embedded Anchor Installation table on page 144 for loads on closer spaced anchors.
- spaced anchors.

 9. Single ply trusses may use either 10dx1½ or 16d nails.

 2 or 3 ply trusses shall use 16d nails.
- 10. NAILS: 16d = 0.162" dia. x $3\frac{1}{2}$ " long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

- 1. Loads include a 60% load duration increase on the fasteners for wind or seismic loading.
- 2. Minimum $f'_{C} = 2500$ psi. Minimum $f'_{m} = 1500$ psi.
- 3. For simultaneous loads in more than one direction, the connector must be evaluated as described in Note e, page 14 under General Instructions for the Designer.
- 4. Install with spoons facing outward and straps spaced no more than 1/8" wider than the truss width.
- 5. The DETAL20 requires 6-10dx11/2" nails in the truss seat and 6-10dx11/2" nails into each strap. For all other models, install half of the required fasteners in each strap
- 6. Lateral loads for META, HETA and HHETA anchors apply only to 2- or 3-ply applications with anchors spaced a minimum of 3" apart. For single-ply applications use lateral loads from the Single Embedded Anchor Installation table on page 144. DETAL lateral loads apply for single-ply application.
- 7. F₁ lateral loads listed may cause an additional 1/16" deflection beyond the standard 1/6" limit where the straps are installed not wrapped over the heel as shown.
- 8. Two HHETA anchors may be installed in a concrete tie beam on a 2- or 3-ply truss with 2 fewer nails for an allowable uplift load of 3050 lbs.
- 9. Noted F1 lateral loads for the DETAL20 may cause an additional 1/32" deflection beyond the standard 1/4" limit.
- 10. Single-ply trusses may use either 10dx1½ or 16d nails with allowable loads limited to the single-ply column. 2- or 3-ply trusses shall use 16d nails.
- 11. NAILS: 16d = 0.162" dia. x 3½" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

MSTAM/MSTCM Straps Ties

MSTAM and MSTCM models are designed for wood to masonry applications.

The MSTC series has countersunk nail slots for a lower nailing profile.

FINISH: Galvanized. Some products are available in stainless steel or ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION:

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

- Use all specified fasteners. See General Notes.
- · Attaches to grouted concrete block and wood framing.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

The MTSM and HTSM offer high strength truss to masonry connections.

MATERIAL: MTSM-16 gauge; HTSM-14 gauge FINISH: Galvanized. See Corrosion Information, page 10-11.

INSTALLATION:

- Use all specified fasteners. See General Notes.
- Installs with hex head Titen® screws.
- Attach to either side of grouted concrete block with a minimum one #5 rebar horizontal.

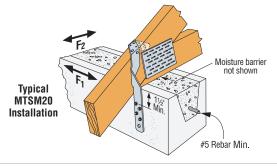

CODES: See page 12 for Code Reference Key Chart.

- Loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- Twist straps do not have to be wrapped over the truss to achieve the allowable load.
 Minimum edge distance for Titen screw is 1½".
 See page 139 for Titen screw information.

- Table allowable loads were determined using test ultimate/3 or fastener calculation values.
- Products shall be installed such that the Titen screws are not exposed to the weather.
- Minimum $f'_m = 1500$ psi and $f'_C = 2500$ psi.
- 8. Lateral loads apply when on the wall side Titen screws are installed into the first four hexagonal holes from the bend line and on the truss/rafter the first seven nail holes near the bend line are filled. Any other fasteners required can be installed in any open hole.
- 9. NAILS: 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information

MTSM16

MGT/HGT Girder Tiedowns

The MGT and HGT series are girder tie downs for moderate to high load applications that are typically installed prior to roof sheathing. The MGT wraps over the heel and is anchored on one side of the truss. The HGT straddles the heel and anchors on both sides of the truss. The HGT is field adjustable, making it suitable for trusses with top chord slopes up to 8:12. The HGT is available in sizes for 2-, 3- and 4-ply widths.

MATERIAL: MGT-12 gauge; HGT-7 gauge

FINISH: MGT— Galvanized; HGT—Simpson Strong-Tie® gray paint

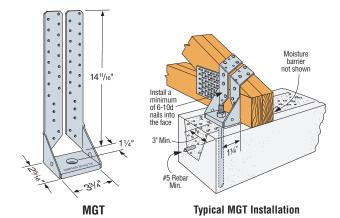

INSTALLATION: • Use all specified fasteners. See General Notes.

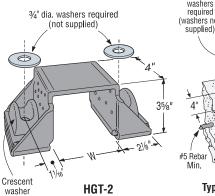

- When the HGT-3 is used with a 2-ply girder or beam, shimming is required and must be fastened to act as one unit.
- Attach to grouted concrete block with a minimum one #5 rebar horizontal in the top lintel block.
- See page 160 for wood applications.

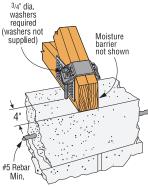

CODES: See page 12 for Code Reference Key Chart.

Model		O.C. Dim	Fasten	ers	DF/SP Allowable	SPF/HF Allowable	Code	
No.	· · · · · · · · · · · · · · · · · · ·		Concrete/ CMU	Girder		Uplift Loads (160)

HGT-3	415/16	73/8	2-3/4	16-10d	10530	9035	I20, F19	
HGT-4	6%16	9	2-3/4	16-10d	9250	9250	. 10	

- . Attached members must be designed to resist applied loads.
- Minimum $f'_m = 1500$ psi and $f'_C = 2500$ psi.
- . To achieve the loads listed for the MGT and HGT, anchorage into a 8" wide concrete tie-beam or grouted and reinforced CMU tie-beam can be made using Simpson Strong-Tie® SET Epoxy-Tie® adhesive with a minimum embedment depth of 12". Vertical reinforcement may be required to transfer the loads per Designer.
- 4. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 5. The MGT can be installed with straps vertical for full table load provided all specified nails are installed to either a solid header or minimum double 2x6 web.
- 6. Table allowable loads were determined using tested lowest ultimate/3 or fastener calculation values
- 7. NAILS: 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

Typical VGT Installation

The LGT, VGT and FGTR products are moderate to high load capacity girder tie-downs for new or retrofit applications.

LGT connectors provide a low profile connection to the wall for easy installation of drywall. Simple to install and can be installed on the inside or outside of the wall.

The Variable Girder Tiedown (VGT) is a higher capacity alternative to the LGT and MGT for girder trusses. It attaches with Simpson Strong-Tie® Strong-Drive® screws (SDS) to the side of truss and features a predeflected crescent washer that allows it to accommodate top chord pitches up to 8:12. The VGT is also available with one flange concealed for attachment to trusses with no tail.

The Face Mount Girder Tie-Down (FGTR) is a non-pitch specific girder tiedown that offers the highest uplift capacity for retrofit applications. The FGTRHL/R is designed for corner hip applications.

MATERIAL: VGT—7 gauge; LGT2—14 gauge; LGT3/LGT4—12 gauge; FGTR—Straps: 7 gauge, Plate: 3 gauge

FINISH: VGT, LGT—Galvanized; FGTR—Powder Coated

INSTALLATION: • Use all specified fasteners. See General Notes.

- Connectors attached using Titen® screws shall have hex heads.
- To achieve the loads listed in the table below, the product shall be attached to a grouted and reinforced block wall or a reinforced concrete wall designed by others to transfer the high concentrated uplift loads to the foundation.
- SDS screws included with LGT3, VGT Series and FGTR Series.

VGT/FGTR:

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

- Screw holes are configured to allow for double installation on a two-ply (minimum) truss.
- The product can be installed in a single application or in pairs to achieve a higher uplift capacity.
- Can be installed on roof pitches up to 8:12 or on a bottom chord designed to transfer the loads.
- FGTR —Only 2 of the 4 holes provided on each strap are required to be filled to achieve the catalog loads. The first Titen HD® anchor ½"x5" (THD) shall be installed a minimum of 4" from the top of the wall. Fasteners shall not be installed in adjacent holes.
- VGT—When installed on trusses with no overhangs, specify VGTR/L.
- VGT—Install washer component (provided) so that top of washer is horizontal as well as parallel with top of wall.

OPTIONS: LGT3 is available with reduced widths of W = 4^{13} /16" – order as LGT3N-SDS2.5. CODES: See page 12 for Code Reference Key Chart.

FGTRHL Installation (FGTRHR similar)

HRS/ST/PS/HST/HTP/LSTA/LSTI/MST/MSTA/MSTC/MSTI Strap Ties

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

Straps are designed to transfer tension loads in a wide variety of applications.

HRS—A 12 gauge strap with a nailing pattern designed for installation on the edge of 2x members. NEW! The HRS416Z installs with Simpson Strong-Tie® Strong Drive® screws (SDS).

LSTA and MSTA—Designed for use on the edge of 2x members, with a nailing pattern that reduces the potential for splitting.

LSTI—Light straps that are suitable where pneumatic-nailing is necessary through diaphragm decking and wood chord open web trusses.

MST—Splitting may be a problem with installations on lumber smaller than 3½"; either fill every nail hole with 10dx1½" nails or fill every-other hole with 16d common nails. Reduce the allowable load based upon the size and quantity of fasteners used.

MSTC—High Capacity strap which utilizes a staggered nail pattern to help minimize wood splitting. Nail slots have been countersunk to provide a lower nail head profile.

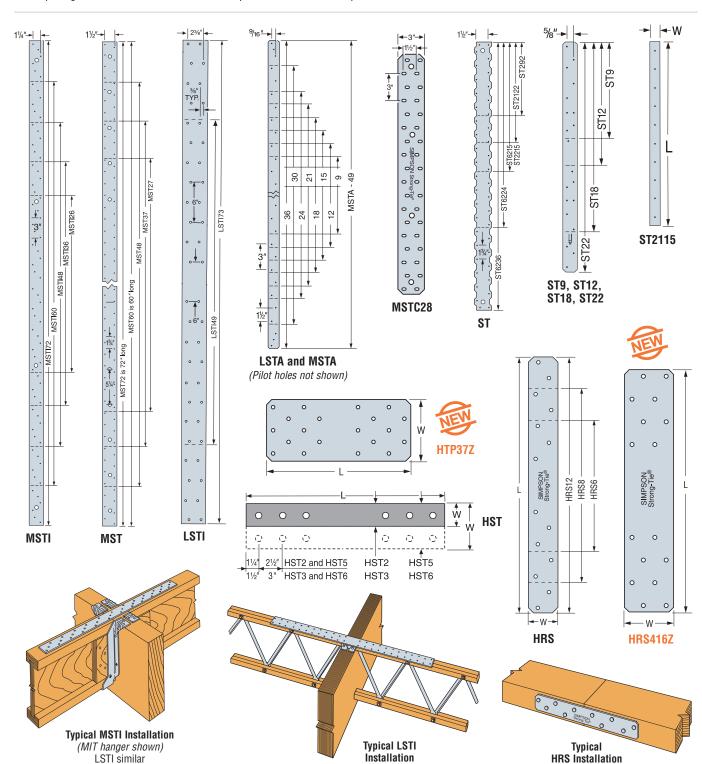

FINISH: PS-HDG; HST3 and HST6-Simpson Strong-Tie® gray paint; all others-galvanized. Some products are available in stainless steel or ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: Use all specified fasteners. See General Notes.

OPTIONS: Special sizes can be made to order. Contact Simpson Strong-Tie.

CODES: See page 12 for Code Reference Key Chart.

MSTC and RPS meet code requirements for reinforcing cut members (16 gauge) at top plate and RPS at sill plate. International Residential Code®–2000/2006 R602.6.1 International Building Code®–2000/2006 2308.9.8 (For RPS, refer to page 172.)

- 1. Loads include a 60% load duration increase on the fasteners for wind or earthquake loading.
- 2 10dx1½" nails may be substituted where 16d sinkers or 10d are specified at 100% of the table loads except where straps are installed over sheathing.
- 3. 10d commons may be substituted where 16d sinkers are specified at 100% of table loads.
- 4. 16d sinkers (0.148" dia. x 31/4" long) or 10d commons may be substituted where 16d commons are specified at 0.84 of the table loads.
- 5. Use half of the nails in each member being connected to achieve the listed loads.
- 6. Tension loads apply for uplift when installed vertically.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

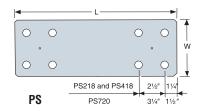

7. NAILS: 16d = 0.162" dia. x 3½" long, 16d Sinker = 0.148" dia. x 3½" long, 10d = 0.148" dia. x 3" long. 10dx1½ = 0.148" dia. x 1½" long. See page 16-17 for other nail sizes and information.

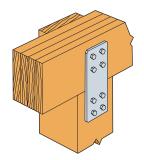

Typical LSTA Installation (Hanger not shown) Bend strap one time only

Model	Material Thickness	Dii	m.	Во	Its	Code Ref.	
No.	Gauge	W	L	Qty	Dia	nei.	
PS218	7 ga	2	18	4	3/4		
PS418		4	18	4	3/4	180	
PS720		6¾	20	8	1/2		

 PS strap design loads must be determined by the Designer for each installation. Bolts are installed both perpendicular and parallelto-grain. Hole diameter in the part may be oversized to accommodate the HDG. Designer must determine if the oversize creates an unacceptable installation.

Typical P\$720 Installation

- Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Allowable loads assume a restrained member of 31/2" min. thickness with bolts in single shear.
- 3. Bolt and nail values may not be combined.
- 4. Only SA36 can be field-bent for other
- intermediate beam widths. 5. **NAILS:** 16d = 0.162" dia. x 3½" long. See page 16-17 for other nail sizes and information.

CS/CMST Coiled Straps

CMSTC provides nail slots for easy installation and coined edges; it can be cut to length. CS are continuous utility straps which can be cut to length on the job site. Packaged in lightweight (about 40 pounds) cartons.

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11. INSTALLATION: • Use all specified fasteners. See General Notes.

- · Wood shrinkage after strap installation across horizontal wood members may cause strap to buckle outward.
- Refer to the applicable code for minimum nail penetration and minimum wood edge and end distances.
- The table shows the maximum allowable loads and the nails required to obtain them. Fewer nails may be used; reduce the allowable load as shown in footnote #3.
- The cut length of the strap shall be equal to twice the "End Length" noted in the table plus the clear span dimension.
- CMST only-Use every other round hole if the wood tends to split. Use round and triangle holes for comparable MST loads, providing wood does not tend to split.
- For lap slice and alternate nailing information, refer to technical bulletin T-CMST (see page 191 for details).
- CS straps are available in 25' lengths, order CS14-R, CS16-R, CS18-R, CS20-R or CS22-R.

CODES: See page 12 for Code Reference Key Chart.

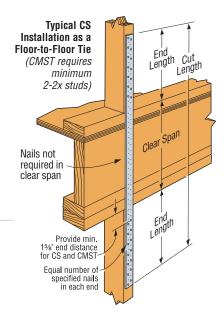

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Loads include a 60% load duration increase on the fasteners for wind or seismic loading.
- 2. Use half of the required nails in each member being connected to achieve the listed loads.
- No. of Nails Used 3. Calculate the connector value for a reduced number of nails as follows: Allowable Load = No. of Nails in Table

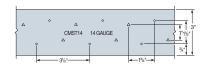

Example: CMSTC16 in DF/SP with 48 nails total. 48 Nails (Used) (Half of the nails in each member being connected) Allowable Load = x 4585 lbs = 3930 lbs 56 Nails (Table)

- 4. Tension loads apply for uplift when installed vertically.
- 5. **NAILS:** 16d = 0.162" dia. x 3½" long, 16d Sinker = 0.148" dia. x 3¼" long, 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

CS16 Hole Pattern (all other CS straps similar)

CMST14 Hole Pattern (CMST12 similar)

CMSTC16 Hole Pattern

Gauge stamped on part for easy identification

TS Twist Straps

Twist straps provide a tension connection between two wood members. An equal number of right and left hand units are supplied in each carton.

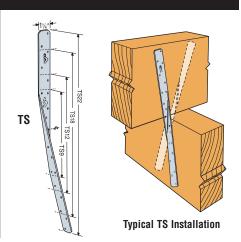

MATERIAL: 16 gauge. FINISH: Galvanized. See Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

. TS should be installed in pairs to reduce eccentricity.

Model No.	L	Fasteners (Total)	Allowable Loads (160)	Code Ref.	
TS9	9	8-16d	530		
TS12	11%	10-16d	665	170	
TS18	17¾	14-16d	930	170	
TS22	21%	18-16d	1215		

- 1. Install half of the fasteners on each end of the strap to achieve full loads.
- 2. Loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 3.16d sinkers (0.148" dia. x 31/4") may be substituted for the specified 16d commons at 0.84 of the table loads.
- 4. Loads are for a single TS.
- 5. **NAILS:** 16d = 0.162" dia. x 3½" long, See page 16-17 for other nail sizes and information.

As an alternative to coil strap, our new FSC-Floor Span Connector connects upper floors to lower floors from the inside of the wall. The convenient obround holes make installation in narrow wall cavities easy. Installs with a ¾" all thread rod, nut and washer (not included).

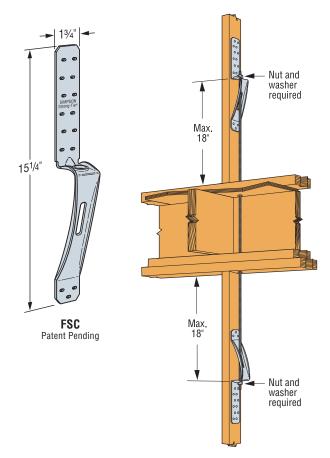

MATERIAL: See table FINISH: Galvanized INSTALLATION:

- Can be used on a single 2x stud.
- Threaded rod, washers and nuts are not supplied with the FSC.
- Use %" threaded rod grade A307 or better, with matching nuts and cut washers.
- FSC may be installed a maximum of 18" from the sill or top plates.
- Drill ½" to ¾" diameter hole through the plates for threaded rod access, hole should be located approximately 1½" away from the face of stud used for FSC attachment.
- Nails can be installed up to 30 degree angle with no reduction in load capacity.

CODES: See page 12 for Code Reference Key Chart.

		Fasten	iers	Allowable T	ension Load	
Model No.	Ga	Stud	Anchor	DF/SP	SPF/HF	Code Ref.
140.		Stuu	Allciloi	(160)	(160)	1101.
FSC	12	15-10dx1½	%" ATR	1830	1570	IP1, F25

- 1. The allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Load values are based on a minimum lumber thickness of 11/2".
- 3. Standard cut washer is required with the 3/8" all thread rod.
- 4. The FSC can be used on offset studs provided the horizontal offset is no greater than 3". Refer to flier F-FSC for more information (see page 191 for details).
- 5. **NAILS:** $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

Typical FSC Installation

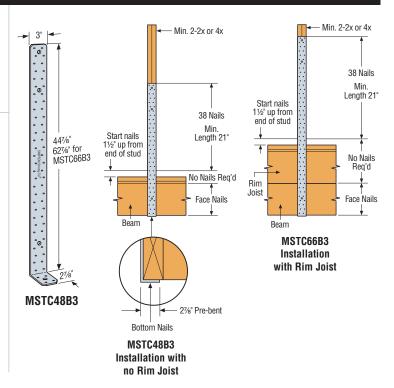

MSTC48B3/MSTC66B3 Pre-Bent Straps

The MSTC48B3 and MSTC66B3 are pre-bent straps designed to transfer tension load from an upper story shearwall to a beam on the story below.

MATERIAL: 14 gauge FINISH: Galvanized

	Dimensions		F	astener	s	Allov	wable	
Model	Be	am	Ве	am			n Loads	Code
No.	Width	Depth	Face	Bottom	Studs/ Post	DF/SP	SPF/HF	Ref.
		(min)		DULLUIII	1 031	(160)	(160)	
MSTC48B3	3	91/4	12-10d	4-10d	38-10d	3930	3380	F26
MSTC66B3	3½	111/4	14-10d	4-10u	30-10u	4440	3820	F20

- Using fewer than 38 nails in the studs/post will reduce the capacity of the connection. To calculate a reduced capacity use 129 lbs. per nail for DFL/SYP or 112 lbs. per nail for HF/SPF.
- Nails in studs/post shall be installed symmetrically. Nails may be installed over the entire length of the strap over the studs/post.
- 3. The 3" wide beam may be double 2x members.
- MSTC48B3 and MSTC66B3 installed over wood structural panel sheathing up to ½" thick achieve 0.85 of table loads.
- Loads govern by the lower of .125" deflection from static tests on wood members, steel ultimate divided by 2, or the calculated nail values.
- 6. NAILS: $16d = 0.162^{\circ}$ dia. x $3\frac{1}{2}^{\circ}$ long, $10d = 0.148^{\circ}$ dia. x 3° long. See page 16-17 for other nail sizes and information.

FTA/LFTA Floor Tie Anchors

SIMPSON Strong-Tie

Designed for use as a floor-to-floor tension tie, one FTA replaces two comparably sized holdowns and the threaded rod.

The LFTA Light Floor Tie Anchor is for nailed installations.

MATERIAL: See table **FINISH**: LFTA—galvanized;

FTA-Simpson Strong-Tie® gray paint **INSTALLATION**: • Use all specified fasteners.

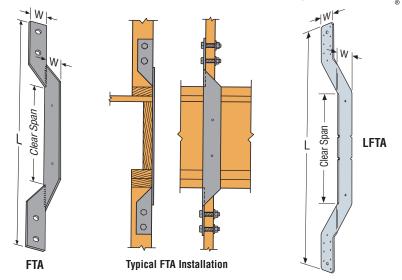

See General Notes.

- · Washers required on side opposite FTA for full loads.
- Nail holes between floors allow preattachment to the joist during installation; these nails are not required.

OPTIONS:

• The standard model's clear span of 17" will accommodate up to a 12" joist. The clear span of the FTA may be increased with a corresponding increase in overall length.

CODES: See page 12 for Code Reference Key Chart.

Model	0-	Di	imensions		Faste (Tot			Allo	wable Upli	ft Loads¹ (1	160)		Code

- 1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Install in pairs.

- 3. Minimum bolt length is (Purlin width + 3" (PCT) + 1" (nut)).
- 4. Bolt value assume minimum 101/2" deep purlin.
- 5. Engineer of record is responsible for evaluating the glulam.

HCSTR Hinge Connector Straps

Use Hinge Connector Straps for retrofit applications to strap horizontal wood members together where a hinge connector interferes.

All bolt holes shall be 1/32" (minimum) and 1/16" (maximum) larger than the bolt diameter (2005 NDS 11.1.2).

MATERIAL: HCSTR2, HCSTR3—7 gauge; HCSTR4—3 gauge FINISH: HCSTR4—Simpson Strong-Tie gray paint.

All others—Galvanized

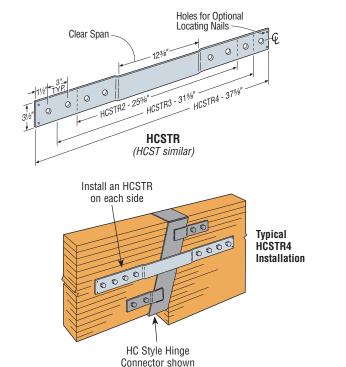

OPTIONS: • Where wood is subject to shrinkage, order an HCST2, HCST3 or HCST4 for straps with obround holes.

• Contact Simpson Strong-Tie for longer lengths. For use with Simpson Strong-Tie® hinge connectors.

CODES: See page 12 for Code Reference Key Chart.

Model		eners tal)	Allowable Loads	Code
No.	Qty	Dia	(160)	Ref.
HCSTR2	4	3/4	9725	
HCSTR3	6	3/4	14170	170
HCSTR4	8	3/4	18770	

- 1. Allowable loads are for straps used in pairs and include a 60% increase for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Allowable loads assume a carrying member of 51/8" minimum thickness with bolts in double shear.
- 3. Designed for HC style hinge connectors; contact Simpson Strong-Tie for lengths for HCA and HC3A (only) style hinge connectors.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

The Hurricane Tie series features various configurations of wind and seismic ties for trusses and rafters.

The H2A features an improved design and higher uplift loads to replace the H2. The H10A has a similar design as the H10 but offers higher uplift capacity.

The H10S provides a high capacity connection from truss/rafter to stud. A flexible nailing pattern allows installation where the stud is offset from the rafter up to 1". Suitable for wood-to-wood and wood-to-CMU/concrete applications.

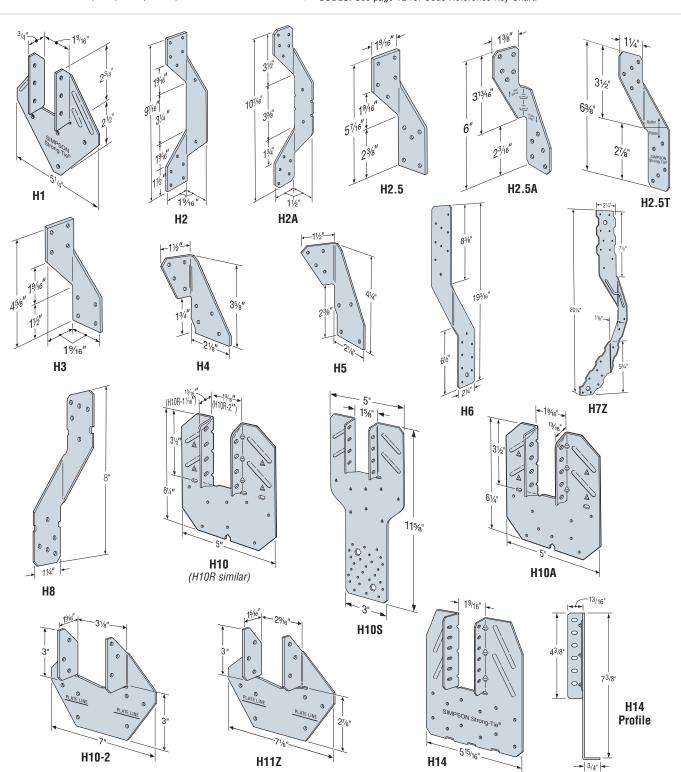

The H2.5T's truncated design was developed to accommodate

trusses with 2x4 bottom chords. The easy to install, five nail pattern is stronger and gets better uplift loads than our popular H2.5 hurricane tie. H1, H10, H10S, H10-2, H11Z and H14 have also been rated for download to provide additional bearing capacity between the truss and wall.

MATERIAL: See table.

FINISH: Galvanized. H7Z and H11Z—ZMAX® coating. Some models available in stainless steel or ZMAX; see Corrosion Information, page 10-11.

- INSTALLATION: Use all specified fasteners. See General Notes.
 H1 can be installed with flanges facing inwards (reverse of H1 drawing number 1).
 - H2.5, H2.5T, H3, H4, H5 and H6 ties are only shipped in equal quantities of rights and lefts. (Rights shown.)
 - Hurricane Ties do not replace solid blocking.
 - Do not drive nails through the truss plate on the opposite side of single-ply trusses, which could force the plate off the truss.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Loads have been increased 60% for wind or earthquake loading with
- no further increase allowed; reduce where other loads govern.

 2. Allowable loads are for one anchor. A minimum rafter thickness of 2½" must be used when framing anchors are installed on each side of the joist and on the same side of the plate (exception: connectors
- installed such that nails on opposite sides don't interfere).

 3. Allowable DF/SP uplift load for stud to bottom plate installation (see detail 15) is 400 lbs. (H2.5); 390 lbs. (H2.5A); 360 lbs. (H4) and 310 lbs. (H8). For SPF/HF values multiply these values by 0.86.
- 4. Allowable loads in the F1 direction are not intended to replace diaphragm boundary members or prevent cross grain bending of the truss or rafter members.
- 5. When cross-grain bending or cross-grain tension cannot be avoided in the members, mechanical reinforcement to resist such forces may be considered.

(Nails into both top plates)

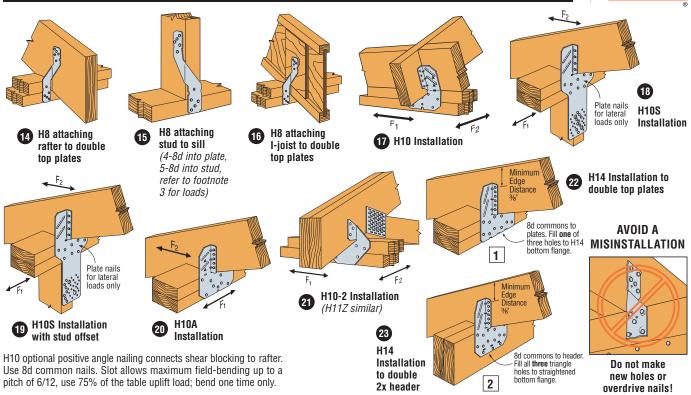

- 6. Hurricane Ties are shown installed on the outside of the wall for clarity and assume a minimum overhang of 31/2" installation on the inside of the wall is acceptable (see General Instructions for the Installer notes u on page 14). For uplift Continuous Load Path, connections in the same area (i.e. truss to plate connector and plate to stud connector) must be on same side of the wall.
- Southern Pine allowable uplift loads for H10A = 1340 lbs. and for H14 = 1465 lbs.
- 8. Refer to technical bulletin T-HTIEBEARING for H1, H10, H10S, H10-2, H11Z, H14 allowable bearing enhancement loads (see page 191 for details).
- 9. H10S can have the stud offset a maximum of 1" from rafter (center to center) for a
- 9. HOS can have the stud onset a maximum of 1 from ratter (*center to center*) for a reduced uplift of 890 lbs. (DF/SP), and 765 lbs. (SPF).

 10. H10S nails to plates are optional for uplift but required for lateral loads.

 11. NAILS: 16dx2½ = 0.162" dia. x 2½" long, 10d = 0.148" dia. x 3" long, 10dx1½ = 0.148" dia. x 1½" long, 8d = 0.131" dia. x 2½" long, 8dx1½ = 0.131" dia. x 1½" long. See page 16-17 for other nail sizes and information.

(Nails into upper top plate)

Considerations for Hurricane Tie Selection

- 1. What is the uplift load?
- What is the parallel-to-plate load?
- What is the perpendicular-to-plate load?
- What is the species of wood used for the rafter and the top plates? (Select the load table based on the lowest performing species of wood.)
- Will the hurricane tie be nailed into both top plates or the upper top plate only?
- What load or loads will the hurricane tie be taking?

Allowable simultaneous loads in more than one direction on a single connector must be evaluated as follows:

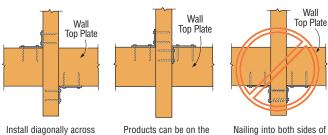

Design Uplift/Allowable Uplift + Design Lateral Parallel to Plate / Allowable Lateral Parallel to Plate + Design Lateral Perpendicular to Plate / Allowable Lateral Perpendicular to Plate < 1.0.

The three terms in the unity equation are due to possible directions that exist to generate force on a hurricane tie. The actual number of terms used in the equation for each condition is dependant on designer's method of calculating wind forces and the utilization of the tie in the structural system.

7. Select hurricane tie based on performance, application, installed cost and ease of installation.

Hurricane Tie Installations to Achieve Twice the Load (Top View)

Both connectors shall be same model.

from each other for minimum 2x truss.

same side of the wall provided they are configured as shown.

a single ply 2x truss may cause the wood to split.

VB Knee Braces

The VB provides lateral resistance force at the bottom of beams when installed approximately 45° or more to the vertical plane.

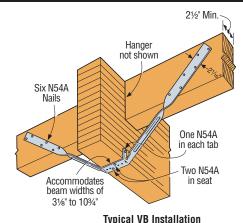

MATERIAL: 12 gauge FINISH: Galvanized

INSTALLATION: • Use specified fasteners. See General Notes.

• 16-N54A fasteners are included with the brace. CODES: See page 12 for Code Reference Key Chart.

Model	Н		Fasteners	Allowable Te	nsion Loads¹	Code

VB12	36" - 42"	12'	16-N54A	990	1240	

The hurricane tie series features various configurations of wind and seismic ties for trusses and rafters.

The H16 series has a presloped seat of 5:12 for double trusses.

The presloped 5/12 seat of the H16 provides for a tight fit and reduced deflection. The strap length provides for various truss height up to a maximum of 131/2" (H16 series). Minimum heel height for H16 series is 4".

The HGA10 attaches to gable trusses and provides good lateral wind resistance. The HS24 attaches the bottom chord of a truss or rafter at pitches from 0:12 to 4:12 to double 2x4 top plates. Double shear nailing allows for higher lateral resistance.

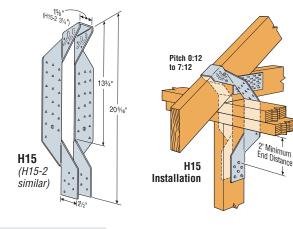

MATERIAL: See table

FINISH: Galvanized. See Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

- The HGA10KT: screws are provided.
- · HS24 requires slant nailing only when bottom chord of truss or rafter has no slope.

CODES: See page 12 for Code Reference Key Chart.

LGT/MGT/VGT/HGT Girder Tiedowns

The LGT, MGT, VGT and HGT are girder tiedowns for moderate to high load capacity applications. The LGT and VGT are also suitable for retrofit applications. LGT connectors provide a low profile connection to the study for easy

installation of drywall. Simple to install and can be installed on the inside or

installation of drywall. Simple to install and can be installed on the inside or outside of the wall. LGT connectors also provide exceptional bearing enhancement for heavy download applications. The LGT series has been extended to include the new LGT4-SDS3 for 4-ply girders.

The Variable Girder Tiedown (VGT) is a higher capacity alternative to the LGT and MGT for girder trusses. It attaches with Simpson Strong-Tie® Strong-Drive® screws (SDS) to the side of truss and features a predeflected crescent washer that allows it to accommodate top chord pitches up to 8:12. The VGT is also available with one flange concealed for attachment to trusses with no tail.

The HGT offers the highest uplift capacity for girders and can be installed on trusses and beams with top chord slopes up to 8:12.

MATERIAL: HGT, VGT—7 gauge, LGT2—14 gauge, MGT, LGT3, LGT4—12 gauge.

FINISH: HGT—Simpson Strong-Tie gray paint; LGT, MGT, VGT—Galvanized

INSTALLATION: • When the HGT-3 is used with a 2-ply girder or beam,

INSTALLATION: • When the HGT-3 is used with a 2-ply girder or beam, shimming is required. Fasten to act as one unit.

- Before installing fasteners, ensure LGT3-SDS2.5 makes complete contact with bottom of truss
- SDS screws included with LGT3, LGT4 and VGT Series.
- · VGT—Screw holes are configured to allow for double installation on a VGT—Screw holes are configured to allow for double installation on a two-ply (minimum) truss.
 VGT—The product can be installed in a single application or in pairs to achieve a higher uplift capacity.
 VGT—When installed on trusses with no overhangs, specify VGTR/L.
 VGT—Install washer component (provided) so that top of washer is horizontal as well as parallel with top of wall top plate.
 LGT3-SDS2.5—The four large hexagon holes are intended for CMU and concrete applications.

LG13-SD2.5—The four large nexagon noies are intended for CMU and concrete applications.
 See page 146-147 for masonry applications.
 OPTIONS: LGT3 and LGT4 are available with reduced widths of W = 413/16" and W = 63%" — order as LGT3N-SDS2.5 and LGT4N-SDS3.
 CODES: See page 12 for Code Reference Key Chart.

Attached members must be designed to resist applied loads. Allowable loads have been increased 60% for wind or earthquake loading with

Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.

LGT2—F1 load = 700 lbs.; F2 load = 170 lbs. with installation of 4-16d sinkers optional nail holes.

LGT3—F1 load = 795 lbs.; F2 load = 410 lbs.

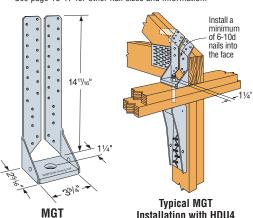

LGT4—F1 load = 2000 lbs.; F2 load = 675 lbs. with installation of 7-16d sinkers in optional nail holes.

LGT4—Uplift for DF/SP girder and SPF studs is 3860 lbs.

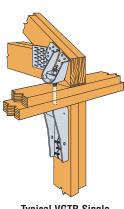

MGT can be installed with straps vertical for full table load provided all specified nails are installed to either a solid header or minimum double 2x6 web.

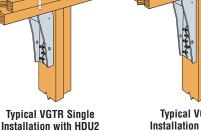

LGT connectors can provide bearing enhancement loads for truss download reactions. The DF/SP allowable load shall be 2060 lbs. for LGT2 and 4100 lbs. for LGT3 and LGT4 (for SPF/HF values use a 0.68 multiplier) For more information refer to technical bulletin T-HTIEBEARING (see page 191 for details)

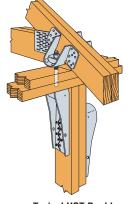

Girder tiedowns installed on the outside of the wall require a $3\frac{1}{2}$ overhang to achieve table loads. NAILS: 16d Sinker = 0.148" dia. x $3\frac{1}{4}$ " long, 10d = 0.148" dia. x 3" long. See page 16-17 for other nail sizes and information.

The Stud Plate Tie series offers various solutions for connecting the stud to the top and bottom plates. All models can be used to make a connection to either the top or bottom plate, and several are suitable for double top plates and studs.

MATERIAL: DSP/SSP/SPH—18 gauge; TSP—16 gauge; all others—20 gauge FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners; see General Notes.

- TSP/DSP/SSP-sill plate installation-fill all round holes.
- TSP/DSP/SSP—top plate installation-fill all round and triangle holes
- SP1/SP2/SP3/SP5—one of the 10d common stud nails is driven at a 45° angle through the stud into the plate.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

SIMPSON
Strong-Tie

The larger LTP5 spans subfloor at the top of the blocking or rim joist. The embossments enhance performance and the min/max nailing option allows for design flexibility.

The LTP4 Lateral Tie Plate transfers shear forces for top plate-to-rim joist or blocking connections. Nail holes are spaced to prevent wood splitting for single and double top plate applications. May be installed over plywood sheathing.

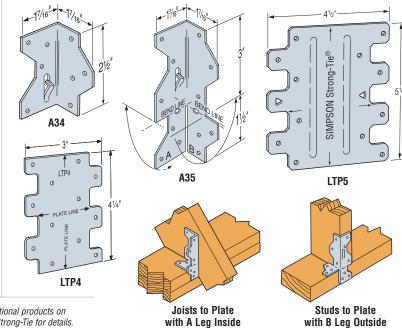

The A35 anchor's exclusive bending slot allows instant, accurate field bends for all two- and three-way ties. Balanced, completely reversible design permits the A35 to secure a great variety of connections.

MATERIAL: LTP4/LTP5-20 gauge; all others-18 gauge
FINISH: Galvanized. Some products available in stainless steel
or ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

- A34-Use 8-8dx11/2 nails.
- A35-Use 12-8dx11/2 nails.
- A35-Use 9-8dx1½ nails for connection types A₁, E, C₁.
- A35-Bend one time only.
- LTP4-Use 12-8dx11/2 nails.
- LTP5-Use 12-8dx1½ nails; G Max use 14-8dx1½ nails.

CODES: See page 12 for Code Reference Key Chart.

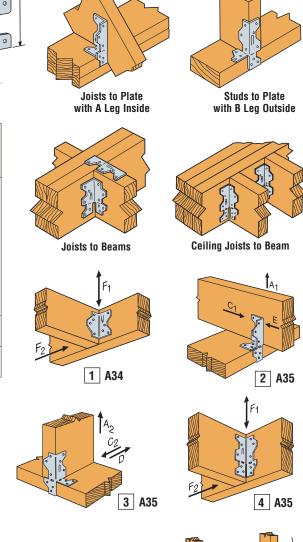

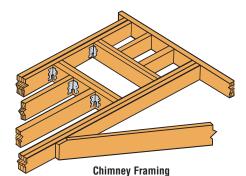

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 2. Roof loads are 125% of floor loads unless limited by other criteria.
- Some illustrations show connections that could cause cross-grain tension or bending of the wood during loading if not reinforced sufficiently. In this case, mechanical reinforcement should be considered.
- LTP4 can be installed over %" structural sheathing with 8dx1½ nails and achieve 0.72 of the listed load, or over ½" and achieve 0.64 of the listed load. 8d commons will achieve 100% load.
- 5. The LTP5 may be installed over structural sheathing up to 1/2" thick using 8dx11/2 nails with no reduction in load.
- 6. Connectors are required on both sides to achieve F₂ loads in both directions.
- 7. **NAILS:** $8dx1\frac{1}{2} = 0.131$ " dia. $x \frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

6 LTP5 Installed over Plywood Sheathing

RBC Roof Boundary Clip

The RBC Roof Boundary Clip is designed to aid installation and transfer shear loads between the roof diaphragm and wall. The locator tabs make proper location of the clip easy. The RBC can be used on wood or masonry walls and will handle roof pitches from 0:12 to 12:12.

MATERIAL: 20 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- · Field bend to desired angle one time only.
- See flier F-RBC for more information on installation and code requirements (see page 191 for details).

CODES: See page 12 for Code Reference Key Chart.

The RBC installed to blocking resists rotation and lateral displacement of rafter or truss. Code references:

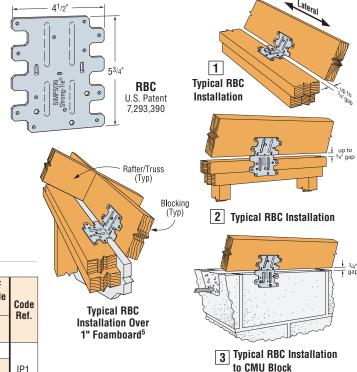

- IRC 2000/2003/2006, R802.8 Lateral Support
- IBC 2000/2003/2006, 2308.10.6 Blocking

Blocking allows proper edge nailing of sheathing. Code references:

- IRC 2000/2003/2006, Table R602.3(1), footnote i
- IBC 2000/2003/2006, 2305.1.4 Shear Panel Connections

Model No.	Type of Connection	Bending Angle	Fasten	iers	DF/SP Allowable Loads	SPF/HF Allowable Loads	Code Ref.
NU.	Connection	Allyle	To Wall	To Blocking	Lateral (160)	Lateral (160)	nei.

RBU	2	30° to 45°	6-10dx1½	6-10dx1½	480	415	F25
	3	0° to 45°	3-1/4x21/4 Titen4	6-10dx1½	350	350	

- 1. Allowable loads are for one anchor attached to blocking minimum 1½" thick. 2. RBC can be installed with up to 3½" gap and achieve 100% of the listed load.
- 3. Allowable loads have been increased 60% for wind or earthquake loading
- with no further increase allowed; reduce where other loads govern. 4. When attaching to concrete use 3-1/4x13/4" Titen® screws.
- 5. RBC installed over 1" foamboard has a load of 395 lbs. (160) in a parallel to wall (F₁) load direction for Douglas Fir. For SPF, the load is 340 lbs.
- 6. NAILS: $10dx1\frac{1}{2} = 0.148$ " dia. $x \frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

The RBC is available with prongs into one side (RBCP) for pre-attachment of the part to a block at the truss plant. Refer to technical bulletin T-RBCP for more information.

SIMPSON

Strong-Tie

A Angles

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

Z2 clips secure 2x4 flat blocking between joists or trusses to support sheathing.

MATERIAL: Z clips—see table. A21 and A23—18 ga.; all other A angles-12 ga.

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use all specified fasteners. See General Notes.

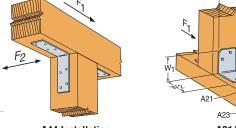

· Z clips do not provide lateral stability. Do not walk on stiffeners or apply load until diaphragm is installed and nailed to stiffeners.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern. Use 0.85 times table load
- ose 0.55 times table load for Hem Fir. Parts should be centered on the face of the member to which they are attached. Wood members for the '3'
- and '5' series must have a minimum width and thickness of 31/2" for table loads to apply.

 5. Wood members for the '4' and
- '7' series must have a minimum width and thickness of 51/8"
- Width and thickness of 5% for table loads to apply. Parts must be used in pairs. Lag bolts of equal diameter (minimum 5" long) may be substituted for machine bolts into beam with no reduction

L/LS/GA Reinforcing and Skewable Angles

-Staggered nail pattern reduces the possibility for splitting. LS-Field-adjustable 0° to 135° angles.

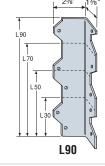

The GA Gusset Angles' embossed bend section provides added strength. MATERIAL: L-16 gauge; GA and LS-18 gauge

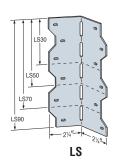

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, page 10-11.

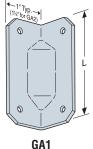

INSTALLATION:

- · Use all specified fasteners; see General Notes.
- LS-field skewable; bend one time only.
- · Joist must be constrained against rotation (for example, with solid blocking) when using a single LS per connection.
- Nail the L angle's wider leg into the joist to ensure table loads and allow correct nailing.

CODES: See page 12 for Code Reference Key Chart.

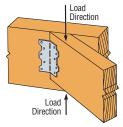

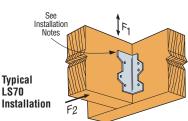

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 5. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

DTT2Z / HD2AHDG Deck Post Connectors

NEW! The DTT2Z is a safe, cost-effective way to attach deck-railing posts to the deck framing. Because the post is tied back into the deck joists, rather than to the rim joist alone, the connection is stronger than typical through-bolt installations and complies with IRC and IBC code requirements regarding handrail and guardrail post connections for decks. The DTT2Z also complies with the new IRC requirements for laterally tying the deck to the house. Additionally, the versatile DTT2Z is load rated as a holdown for light-duty shearwalls and braced wall panel applications. The DTT2Z fastens easily to a single 2x joist or stud using Simpson Strong-Tie® Strong-Drive® screws (SDS) (included) and accepts a ½" machine bolt or anchor bolt.

The HD2AHDG holdown has been tested as a lateral anchor for the guardrail post connection. See technical bulletin T-HDAGDRL06 for more information and installation details (see page 191 for details). The HD2AHDG is also load rated as a holdown for light duty shearwalls and braced wall panels.

MATERIAL: DTT2Z—14 gauge; HD2AHDG Body—12 gauge, Base—7 gauge FINISH: DTT2Z—ZMAX coating; HD2AHDG—HDG and may be ordered galvanized; see Corrosion Information, page 10-11.

INSTALLATION: Use all specified fasteners. See General Notes.

DTT2Z

- A standard cut washer (refer to General Notes) must be installed between the nut and the seat.
- Simpson Strong-Tie SDS screws install best with a low speed high torque drill with a %" hex head driver.

HD2AHDG

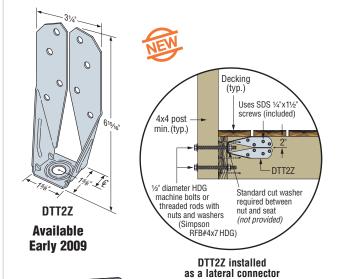

- Bolt holes shall be a minimum of ½2" to a maximum of ½6" larger than the bolt diameter (per NDS, section 11.1.2).
- A washer is not required between the base plate of the holdown and the anchor nut.
- Locate on wood member to maintain a minimum distance of seven bolt diameters, distance is automatically maintained when end of wood member is flush with the bottom of the holdown.
- · Bolts should be snugly tightened.

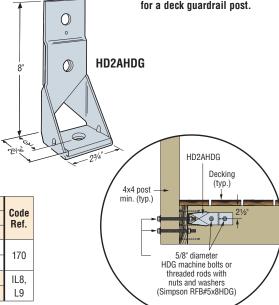

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. The allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed.
- Installations shown are for post to joist connections, however these products can be used as a holdown or tension tie for other applications.
- 3. Load values are valid if the product is flush with the end of the framing member or installed away from the end.

HD2AHDG installed as a lateral connector for a deck guardrail post.

DPTZ Deck Post Tie

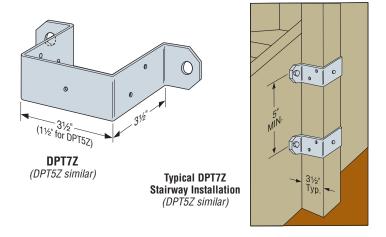

The DPTZ Deck Post Tie products are used to attach 2x4 (DPT5Z) or 4x4 (DPT7Z) vertical posts to the side of stringers, rims or other wood members.

MATERIAL: 14 gauge

FINISH: ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION:

- Use specified HDG fasteners. See General Notes.
- Install in pairs at a recommended minimum center to center spacing of 5".
- Install with two %" through bolts into side member and 5-10dx1½ to post for DPT5Z or 5-10d for DPT7Z.

DJT14Z Deck Joist Tie

The DJT14Z Deck Joist Tie is designed to attach 2x deck joists to the side of 4x or lesser support posts. The DJT14Z can be installed with either nails or bolts.

MATERIAL: 14 gauge

FINISH: ZMAX® coating; see Corrosion Information, page 10-11. INSTALLATION: • Use specified HDG fasteners. See General Notes.

- · Recommended: install on post first.
- Minimum 2x4 joist and 4x4 post.

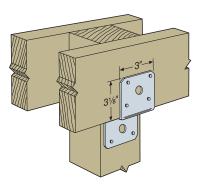

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

	F	astener	s		Allowab	le Loads

- 1. Loads are for one DJT14Z.
- 2. Roof loads are 125% of floor loads. Floor loads may be adjusted for other load durations according to the code, provided they do not exceed the roof loads.

 3. NAILS: 16d = 0.162" dia. x 3½" long. See page 16-17 for other nail sizes and information.

Typical DJT14Z Installation

DBT1Z Deck-Tie® Connectors

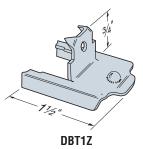

The DBT1Z deck-board tie provides a nail-free surface fastening system for deck boards. Eliminates countersinking, hammer dents, nail popping, ugly nail heads and rust stains on surface. Leaves an unbroken deck surface that is easy to sand and refinish when it's time for maintenance.

MATERIAL: 18 gauge

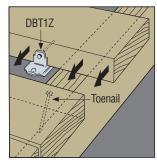

FINISH: ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Use specified HDG fasteners. See General Notes.

- DBT1Z Deck Board Tie: Position the DBT1Z with the locator prongs and install with a single 10dx11/2" HDG nail. Other edge of deck board shall be toenailed (see drawing). Using dry lumber will minimize deck board movement after installation. Works with 2x deck boards, 5/4 deck boards (pre-drilling may be required), or composite deck boards a minimum 1" thick (pre-drilling may be required). To check number of DBT1Z multiply number of joists by number of deck boards. The DBT1Z will not prevent cupping, bowing or warping of deck boards.
- 1 box of 50 covers approximately 25 sq.ft. based on 6" deck boards on joists spaced at 16" on center.

Typical DBT1Z Installation Connectors slide under anchored deck board.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

TAZ Staircase Angles

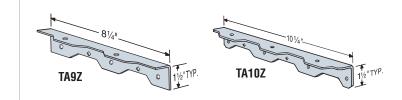

For use in structurally-sound staircase framing. The TA eliminates costly conventional notching.

MATERIAL: 12 gauge

FINISH: ZMAX coating; see Corrosion Information, page 10-11.

ORDER: May be ordered as kits with model numbers TA9ZKT and TA10ZKT. Each kit includes two ZMAX TA's and either double barrier coated or HDG Simpson SDS 1/4" x 11/2" screws.

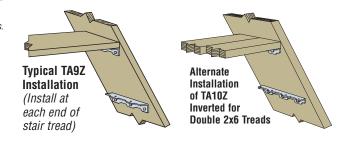

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model No. Str		Faste	eners	Allowable	Code
		Stringer	Tread	Downloads DF/SP (100)	Ref.
	TA9Z	3-SDS 1/4"x11/2"	2-SDS 1/4"x11/2"	885	
	TA10Z	3-SDS 1/4"x11/2"	4-SDS 1/4"x11/2"	885	170
	TA10Z	4-SDS 1/4"x11/2"	3-SDS 1/4"x11/2"	1180	

- 1. Loads may be adjusted for other load durations according to the code.
- 2. See page 20 for SDS screw information.

The ML angle combines strength and versatility through the use of Simpson Strong-Tie® Strong-Drive® screws (SDS). Fastener holes are staggered to minimize wood splitting and opposing hole patterns allows for back to back installation without fastener interference.

MATERIAL: 12 gauge

FINISH: ZMAX® coating, see Corrosion Information, page 10-11. **INSTALLATION**: • Use all specified fasteners. See General Notes.

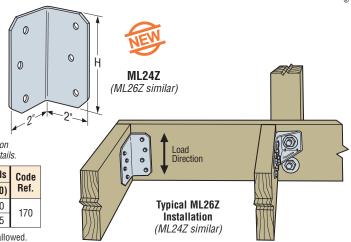

• Simpson Strong-Tie SDS 1/4"x11/2" are not provided with the angle.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

DECK SPACERS™ Deck Board Spacing

Deck Spacers are small plastic spacers that easily clip onto deck joists during installation to ensure evenly spaced deck boards, enabling quicker installation and reducing labor costs. Deck Spacers are ideal for composite decking and help meet manufacturer warranty requirements. They stay on the joist permanently to help shed debris and moisture off of deck joists for easier wet or dry cleaning. For more information request flier F-DECKSPCR (see page 191 for details).

Features:

- · Provides permanent deck board spacing.
- · Quickly and easily snap into place.
- · Meet composite decking warranty requirements for spacing.
- UV materials last the life of deck.
- 3 colors to match decking: Gray, Brown and Tan.

INSTALLATION:

- Position the first deck board and fasten. Position Deck Spacers on the deck joists, and slide next deck board snugly against the spacer.
- Fasten deck board with appropriate fasteners and repeat the process.

PGT® Pipe Grip Ties®

Pipe Grip Ties attach wood fence rails to metal fence posts, eliminating rotted and failed wood posts. The PGT is suitable for standard applications as well as corners and splices.

The PGTIC2Z-R is an interior corner pipe grip tie.

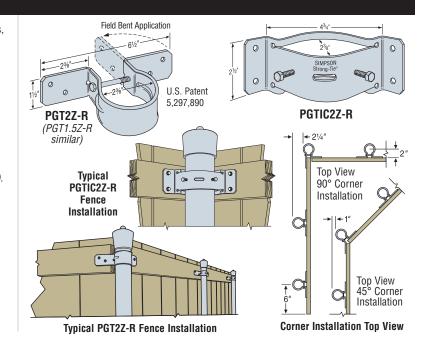

The PGT1.5Z-R is for 11/2" pipe (17/8" outside diameter), and the PGT2Z-R for 2" pipe (23/8" outside diameter).

MATERIAL: 12 gauge

FINISH: ZMAX® coating, also available in G90.

INSTALLATION: • Use all specified fasteners. See General Notes.

- PGTIC2Z-R to Post Install two set screws (supplied) with 3/8 socket in predrilled holes.
- PGTIC2Z-R to Rails Use Simpson Strong-Tie® Strong-Drive® 1/4"x11/2" wood screws (SDS) (not supplied).
- · Install on vertical pipes, offsetting corners to allow for the correct rail alignment.
- Use 3 to 4 PGTs per pipe; line up to stringline.
- Fasten PGT with 1/4" hex head bolt (supplied).
- PGT attaches to rails with four Simpson Strong-Tie SDS 1/4" x 11/2" HDG wood screws (not supplied). See page 20 for SDS screw information.
- 1/4" lag bolts may be used. Follow the code requirements for predrilling.
- Nail fence boards to rails.
- · Field bend PGT flanges to fit corner and angled conditions (bend one time only).

E-Z Base[™]/E-Z Mender[™]/E-Z Spike[™] Fence Products

Replacing an entire fence can be an expensive and difficult task. Simpson Strong-Tie® offers a line of products designed to help make reinforcing fence posts easy and economical. The E-Z Base, E-Z Mender and E-Z Spike offer simple solutions for all types of fence post projects.

E-Z Spike (Model No. FPBS44)

- Allows easy installation of 4x4 wood posts without digging
- holes or pouring concrete.

 Can be used for a variety of applications where quick-to-install posts are needed.

E-Z Mender (Model No. FPBM44)

- Allows easy repair of rotted or damaged 4x4 wood posts installed in concrete or dirt.
- · Reinforces weakened wood posts without having to replace the post or the concrete.

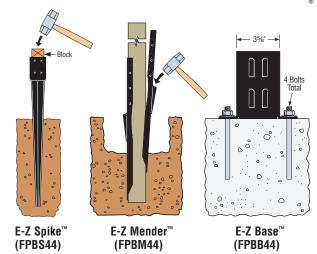

E-Z Base (Model No. FPBB44)

• Allows easy installation of 4x4 wood posts on existing concrete.

MATERIAL: 12 gauge FINISH: Black powder-coat
INSTALLATION: • See flier F-EZFPP (see page 191 for details).

 Attach post to E-Z Spike or E-Z Base with 8-1/4" SDS screws or 1/4" HDG lag screws and attach post to E-Z Mender using 6 HDG nails or screws per part. NOTE: • Notwithstanding the terms of the Limited Warranty, Simpson Strong-Tie

does not guarantee, represent or warrant that this product will perform under, or prevent or reduce damage caused by corrosion, any seismic, wind, atmospheric, or other load-producing event.

FB/FBR Fence Brackets

FB and FBR fence brackets make the connection between fence rails and posts simple and strong. Eliminates the need for toe nailing or screwing. Clean, versatile connections make planning and building fences, deck/porch railings and louvers easier and faster.

MATERIAL: See table

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION: • Holes are sized for 8dx1½", 8d commons or #6 wood screws into the supporting member.

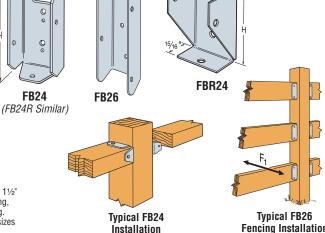

- FB24R is sized for 10dx1½".
- FB26 is sized for #14x34" lag screws.

CODES: See page 12 for Code Reference Key Chart.

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

Model	Ga	Member	Dimensions			Code

FBR24	18	2x4	19⁄16	27/16	1½	
FB26	18	2x6	19⁄16	5	1½	

- 1. FB26 has an allowable load for F₁ of 365 lbs.
- 2. FBR24: R = rail (not rough).
- 3. **NAILS:** 10dx1½ = 0.148" dia. x 1½" long, 8d = 0.131" dia. x 2½" long, $8dx1\frac{1}{2} = 0.131$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

Fencing Installation

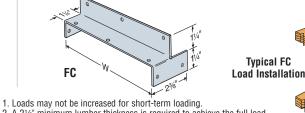

FC Framing Clips

For fast, accurate framing. Three-dimensional nailing pattern results in high-strength joint values. Ideal for fence construction.

MATERIAL: 16 gauge FINISH: Galvanized

INSTALLATION: Use all specified fasteners. See General Notes. CODES: See page 12 for Code Reference Key Chart.

Model No.	w	Fasteners	Allowable F ₁ Loads (100)	Code Ref.
FC4	3%16	8-16d	800	l14,
FC6	5½	10-16d	920	L4, F13

2. A 2½" minimum lumber thickness is required to achieve the full load.

3. NAILS: 16d = 0.162" dia. x 3½" long. See page 16-17 for other nail sizes and information.

BT Brick Ties

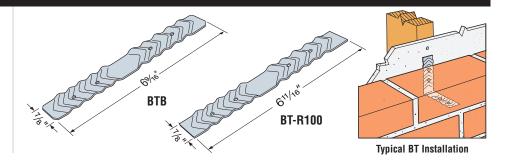

Brick Ties provide a connection between the wood structure and brick façade.

MATERIAL: 22 gauge

FINISH: Galvanized, available in Type 304 stainless steel (order as BTBSS).

· Holes sized for 10d commons. See code for spacing requirements.

CODES: IRC 2003/2006. R703.7.4 TO ORDER: BT-R100 = retail pack of 100 BTB = bulk carton of 500

RR Ridge Rafter Connector

An interlock provides alignment control and correct nailing locations. For a rafter-to-face connector, flatten the top flange into the face plane. The RR may be used with rafters sloped up to 30°.

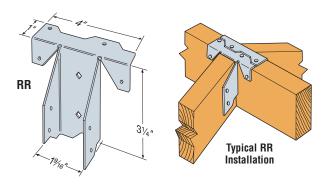

MATERIAL: 18 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

CODES: See page 12 for Code Reference Key Chart.

Madal	Min.	Faste	eners	11-1:44	Allowabl	e Loads¹	0-4-
Model No.	Rafter	Header	Rafter	Uplift (160)	DF/SP Code		Code Ref.
110.	Size	licauci	Haitei	Floor (100)		Roof (125)	11011
RR	2x6	4-10dx1½	4-10dx1½	130	365	415	I10, L3, F9

- Floor loads may be adjusted for other load durations according to the code, provided they do not exceed the table roof loads.
- 2. **NAILS:** 10dx11/2 = 0.148" dia.x11/2" long. See page 16-17 for other nail sizes and information.

PSCL/PSCA Panel Sheathing Clips

Simpson Strong-Tie® Panel Sheathing Clips are used to brace unsupported sheathing edges. The PSCA is a new version of the PSCL with less material for a more cost effective solution. Model sizes include: PSCL3/6, PSCA7/16, PSCL7/16, PSCL15/32, PSCL15/32, PSCL1/2, PSCL5/6; PSCL19/32, PSCL3/4.

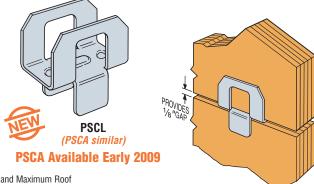

MATERIAL: 20 gauge FINISH: Galvanized

INSTALLATION: • Use the same size sheathing clip as the panel thickness.

 Maximum spans may be reduced for low slopes or high uniform loads, refer to manufacturer's installation instructions.

CODES: See page 12 for Code Reference Key Chart.

Span Panel		Maximum Roo	of Sheathing Span	No. of Clips	Code
Rating	Thickness	With Clip	Without Clip	Per Span	Ref.
24/0	3/8	24	20	1	
24/16	7/16	24	24	1 ²	
32/16	15/32, 1/2	32	28	1 ²	180
40/20	5/8, 19/32	40	32	1	
48/24	3/4	48	36	2	

- Span rating and Maximum Roof Sheathing Spans are for reference only, refer to IBC Table 2304.7 (3) for additional important information.
- 2. Maximum roof sheathing span with single PSCA is 24". For spans > 24" use two PSCA's.

Typical PSCL Installation

SBV/CF-R Shelf Brackets/Concrete Form Angles

Use the SBV for shelving, counter brackets, window ledge supports, at a very competitive price.

The CF-R is used where a moderate size shelf bracket and reinforcing angle is needed. When used for tilt-up perimeter forming, the nail hole placement ensures substantial re-use.

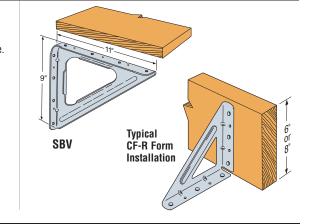

MATERIAL: 16 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

- SBV—Reversible for nominal 10" or 12" shelves of any thickness.
- CF-R (Retail Pack)—Recommended spacing is 36" for 2x's and 18" for 1x's.
 Use the 5" leg for 6" lumber and the 6" leg for 8" lumber. Holes are sized for 1/4" fasteners or 10d commons.

CODES: See page 12 for Code Reference Key Chart.

Model Fasteners		DF/SP Allowable Downloads	Code
No.	Stud	(100)	Ref.
CF-R	3-SDS 1/4"x2"	135	170
SBV	4-SDS 1/4"x2"	145	170

DS Drywall Stop

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

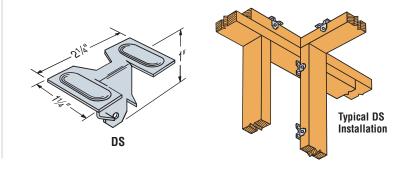

Eliminates costly blocking at top plate, end walls, and corners. A typical residence will use several hundred of these inexpensive clips with a substantial savings in blocking and labor.

The installation prongs provide even more labor savings.

MATERIAL: 20 gauge FINISH: Galvanized INSTALLATION:

- 16" on center or less, using 8d commons.
- DS should not be used where gypsum board is used for structural loads.

CODES: ICC NER-413. ICC-ER 5672.

The RTC series secures two wood members to a vertical post forming a 90° corner. The RTC42 and RTC44 are heavy-duty structural connectors. Based on loads of 40 lbs. per sq. ft., a 10'x10' deck can be built using 2x8 $\,$ joists and 4 RTC42s. See the table for post and joist sizes.

RTB—a bracket for intersecting 2x members.

FWH—4 way connectors for 2x members with bendable flanges.

RTA—connects two 2x wood members at a 90° angle.

RTF—connects two members in a "pass-through" application.

RTR and RTU—a 2x member crosses another.

MATERIAL: RTC44—14 gauge; RTA2—16 gauge;

RTR and RTB-20 gauge; all others-18 gauge

FINISH: Galvanized. Some products available in stainless steel or ZMAX® coating; see Corrosion Information, page 10-11.

INSTALLATION:

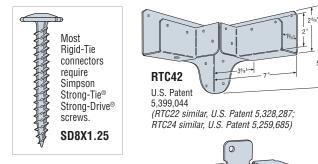

- Use all specified fasteners. See General Notes.
- · Install vertical members first, then attach horizontal members for easier alignment.
- · Seat wood member in bracket with a C-clamp before securing to aid positioning and prevent skewing.
- · Always follow manufacturer's instructions when using power tools and building equipment.

CODES: See page 12 for Code Reference Key Chart.

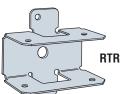

These products are available with additional corrosion protection. Additional products on this page may also be available with this option, check with Simpson Strong-Tie for details.

- 1. Allowable loads must be equally distributed on both joists.
- 2. Loads are for Doug Fir Larch.
- 3. NAILS: 16d = 0.162" dia. x 31/2" long, 16d Sinker = 0.148" dia. x 31/4" long, $10dx1\frac{1}{2} = 0.148$ " dia. x $1\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

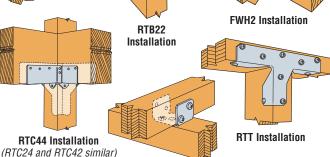

WARNING: Industry studies show that hardened fasteners can experience performance problems in wet and corrosive environments. Accordingly, use the SD8X1.25 screw in dry, interior, and non-corrosive environments only.

RTR Installation

U.S. Patent 5,372,448

RTU Installation

J/JP Floor Beam Levelers

Jack piers and standard floor beam levelers offer unique leveling simplicity during and after construction.

MATERIAL: 12 gauge plates, 3/4" threaded rod, 11/16" O.D. steel pipe FINISH: None. Connectors installed in damp areas, or corrosive environments that are not exposed to rain or periodic washing, will deteriorate at a faster rate. Corrosion-resistant finishes and maintenance can improve the connector's service life.

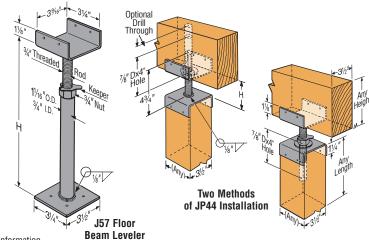

INSTALLATION: • Use all specified fasteners. See General Notes.

- Holes are provided for installation with 4-10dx11/2" nails.
- Do not use J/JPs for dynamic jacking of structures, such as houses.

CODES: See page 12 for Code Reference Key Chart.

- 1. PSPN516Z-12-16d nails into sill plate achieves 1365 lbs. for DF/SP, and 1180 lbs. for SPF/HF. 16-16d nails in to top plates achieves 1820 lbs. for DF/SP, and 1575 lbs. for SPF/HF.
- 2. To meet the prescriptive IRC requirement 16d box nails (0.135" dia. x 31/2") may be used.
- 3. **NAILS:** 16d = 0.162" dia. x 3½" long, 8d = 0.131" dia. x 2½" long. See page 16-17 for other nail sizes and information.

Miscellaneous

HSS/SS Stud Shoes

SIMPSON

Stud Shoes reinforce studs notched in construction. They are NOT a total replacement of removed material. Installs over pipe up to 2%" outside diameter. HSS2-3 is designed for triple 2x studs.

HSS Stud Shoes provide tension load capacity as well as increased compression loads. Flared flange provides greater strength.

MATERIAL: 16 gauge FINISH: Galvanized

INSTALLATION: Use all specified fasteners. See General Notes.

- HSS: Bend flanges at 90° angle during installation, then bend back and screw into position (screws supplied).
- · Bend flanges one cycle only.

CODES: See page 12 for Code Reference Key Chart.

HSS2-SDS1.5 (16 gauge) Heavy stud shoes to reinforce and protect single 2x studs where pipe is located. Uses 12 Simpson Strong-Tie® Strong-Drive® $\frac{1}{4}$ "x1 $\frac{1}{2}$ " screws (SDS) (included).

- IRC 2006 R602.6 and P2603.2.1
- IBC 2006 2308.9.10 & 2308.9.11
- IPC 2000/2003/2006 305.8

HSS2-3-SDS3 (16 gauge) Heavy stud shoe for triple 2x stud. Uses 12 Simpson Strong-Tie SDS 1/4"x2" screws (included).

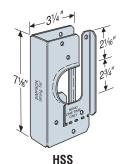

- IRC 2006 R602.6 and P2603.2.1
- IBC 2006 2308.9.10 & 2308.9.11
- IPC 2006 305.8

SS1.5 (16 gauge) stud shoes reinforce and protect plumbing in 2x.

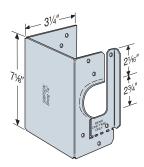

- IRC 2006 R602.6 and P2603.2.1
- IBC 2006 2308.9.10 & 2308.9.11
- IPC 2006 305.8

RPS Strap Ties

The RPS meets IBC, IRC and City of Los Angeles code requirements for HVAC and pipes in walls.

FINISH: Galvanized, some products available in ZMAX® coating. See Corrosion Information, page 10-11.

INSTALLATION: Use all specified fasteners. See General Notes.

CODES: See page 12 for Code Reference Key Chart.

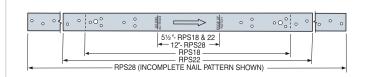

Use RPS22 or RPS28 (16 gauge) to reinforce top plate. Use RPS18Z, RPS22Z or RPS28Z (16 gauge ZMAX) to reinforce sill plate.

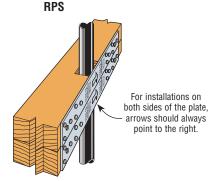

- International Residential Code®- 2006 R602.6.1

- 1. Loads include a 60% load duration increase on the fasteners for wind or earthquake loading.
- 2. To meet the prescriptive IRC requirement 10dx11/2 (0.148" dia. x 11/2" long) may be used.
- 3. **NAILS:** 16d = 0.162" dia. x $3\frac{1}{2}$ " long. See page 16-17 for other nail sizes and information.

Typical RPS Installation (Only one strap may be necessary to meet IRC requirements)

NCA/TB/LTB Bridging

Precision-formed into a rigid "V" section.

NCA—Nailless installation eliminates callbacks for nail squeaks. Designed for secure grip before the drive-home blow, and deeper prong penetration.

TB—Tension-type bridging with maximum nailing flexibility. Use just two of the seven nail holes at each end.

LTB—Staggered nail pattern accommodates 2x8 and 2x10 joists. Use just two of the six nail holes at each end. LTB40 has rigid prongs that install easily into the joist, and embossments that allow crisp bends.

MATERIAL: LTB—22 gauge; NCA and TB—20 gauge (except NCA2x12-16—18 gauge).

FINISH: Galvanized

INSTALLATION: • Support floor joists with a depth-to-thickness ratio of six or more with bridging at intervals not exceeding 8'. If span is greater than 8', install on 2x8 or larger joists. If span is greater than 16', use more than one pair.

- Tension bridging works only in tension, so must be used in cross pairs.
- Install bridging tightly; loose installation may allow floor movement.
- NCA may be installed before or after sheathing, from the top or bottom.
 Simply locate the bend line approximately 1" from the joist edge.
- NCA has nail holes in one end for use if a prong is bent during installation.
 Fully seat nails if they are used; otherwise, they may lead to squeaks.
- TB requires two 10dx1½ fasteners per end.
- LTB requires two 6d commons per end.

CODES: See page 12 for Code Reference Key Chart.

Code Reference: IRC 2003/2006, R502.7.1

Space bridging to avoid contact noises.

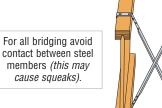

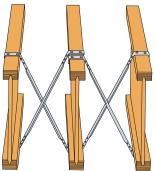

Install from below as shown, or from above. Drive upper end into joist approximately 1" from the top.

Typical TB Installation

WB/WBC/TWB/RCWB Wall Bracing

Simpson Strong-Tie® Wall Bracing products offer effective options to resist racking during construction. Additionally the RCWB and WB/WBC can be used to fulfill the same code bracing requirements as a 1x4 let-in brace, but are cost effective and faster to install. Not designed to replace structural panel shearwall load-carrying component.

The WBC *(coiled WB)* multiple product dispenser pack weighs less than 40 pounds, making storage and transportation easy. WB106C—15 pieces per roll, WB126C—12 pieces per roll, WB143C—10 pieces per roll.

The RCWB features a rolled edge (the TWB has two rolled edges) for extra strength and safety.

MATERIAL: WB and WBC—16 gauge; TWB—22 gauge; RCWB—20 gauge FINISH: Galvanized

INSTALLATION: • Use all specified fasteners. See General Notes.

WB and WBC: • Install in "X" pairs or in opposing "V" fashion.

- Use with 16" or 24" o.c. 2x4 (min.) studs.
- RCWB and TWB: Use with 16" o.c. studs.
- Use minimum of 2x4 studs with TWB.
- Use minimum of 2x6 studs with RCWB (2x4 min. for interior, non-bearing wall).
- Establish a run-line using the bracing as a straight edge. Single cut a saw kerf 5/6" deep (TWB) or 11/6" deep (RCWB) along the run line. If the wall is pre-framed on the floor, place the part into the saw kerf, and put one nail into the top plate. Tilt the wall up and plumb before nailing off top plate, bottom plate and studs according to the nailing schedule.

Typical RCWB Installation

WB or WBC Wall Bracing "X" and "V" Applications

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

CFVL Ledger Connector System

The ICFVL Ledger Connector System is engineered to solve the challenges of mounting wood or steel ledgers to insulated concrete form (ICF) walls. The ICFVL is designed to provide both vertical and lateral, in-plane performance. There are many benefits over traditional anchor bolting, including better on center spacing in most cases, faster installation and no protrusions.

The embedded legs of the ICFVL are embossed for additional stiffness and the hole allows for concrete to flow through and around the connector. The exposed flange on the face of the ICF provides a structural surface for mounting either a wood or steel ledger.

MATERIAL: ICFVL—14 gauge: ICFVL-CW and ICFVL-W—16 gauge

FINISH: Galvanized

INSTALLATION: ICFVL in ICF

- For use with a minimum 4" thick core.
- Snap a chalk line for the bottom of the ledger.
- Mark required on center spacing.
- . Use ICFVL to mark kerfs locations.
- · Cut kerfs as marked.
- . Insert ICFVL flush to the face of the ICF.
- · Pour concrete.

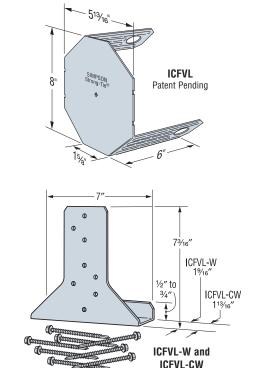

Wood Ledger Attachment - ICFVL-W or -CW

- · Slip appropriate ledger connector underneath the ledger.
- Install the eight ICF-D3 screws partially into the ledger.
- Position the ledger level to the chalk line and drive the screws through the wood and into the ICFVL.

Steel Ledger Attachment

- Position the ledger level to the chalk line and against the ICFVL.
- Attach with four 1/4-14x3/4", #3 drill point screws (not provided).
- All screws should be located at least 1/2" from the edge of the ICFVL.
- · Space screws evenly.

CODES: See page 12 for Code Reference Key Chart.

Lodger		Allowable Lo	ads (lbs)
Ledger Type	Fasteners	Download (100/115/125)	Lateral F ₁ (160)
Wood	8-ICF D3	1940	1905
Steel	4-1/4X3/43	1660	1525

1. Fasteners for wood ledger (D3) are provided with the part and fasteners for steel ledger are not provided.

WARNING:

Industry studies show

that hardened

fasteners can experience

performance problems

in wet environments.

Accordingly, use this

product in dry

environments only.

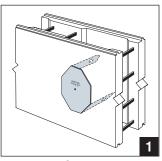

- 2. Loads apply to ICF foam thicknesses of 23/4" or less. 3. Alternately, #14 x 3/4" fastener may be used.
- 4. Tabulated loads may not be increased.
- 5. Concrete f'c = 2500 psi minimum.
- 6. When combining download and lateral loads, Designer shall evaluate as follows: Design Download/Allowable Download + Design Lateral Load/Allowable Lateral Load ≤ 1.

These tables address vertical load applications only.

54 mils (0.054")	ICFVL	15	30	45	48	12	24	36	48	_	_	_	_	_	_	_	_	Г24

- 1. The Designer may specify different spacing based on the load requirements.
- 2. Spacings are based on perpendicular to grain capacity of bolt in wood ledger compared to tested value of ICFVL. Additional connectors required for out-of-plane loads.
- 3. See flier F-ICFVL for additional connection details (see page 191 for details).
- 4. For steel ledgers, the 68 mil ledger spacing is closer than the 54 mil ledger because the calculated load of a bolt is higher in a thicker piece of steel.
- 5. Steel ledger values are based on steel. $F_{IJ} = 60$ ksi.

C-2009 © 2008 SIMPSON STRONG-TIE COMPANY INC. PRINTED 12/08

The Architectural Products Group consists of aesthetically pleasing, pre-finished connectors and innovative concealed joist ties designed for exposed wood applications. These connectors provide structural performance and, at the same time, add a unique appearance feature to a project. Refer to Simpson Strong-Tie® C-APG catalog.

• ARCHITECTURAL FINISHES

Eliminate time consuming prep work and costly field painting. Available finishes include textured flat black powder-coat, gray paint and hot-dip galvanized coating.

AVAILABILITY

Select products are in stock and readily available. Contact Simpson Strong-Tie for product availability and lead times for non-stocked items.

PRE-ENGINEERED AND TESTED

Load-rated products are verified to perform to design loads, unlike custom designed and fabricated connectors.

QUALITY ASSURANCE

No-Equal quality-controlled manufacturing ensures product consistency and high quality.

Products shown in this section come with textured flat black powder-coat unless otherwise noted. Most are also available with a galvanized coating or gray primer. Contact Simpson Strong-Tie for availability.

www.strongtie.com/apg

BP - BEARING PLATES

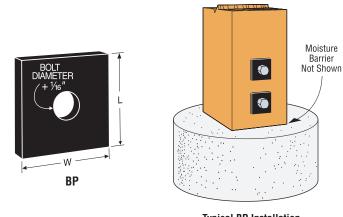

Bearing Plates give greater bearing surface than standard cut washers, and help distribute the load at these critical connections.

SPECIAL ORDER PLATES

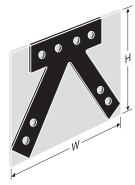

Simpson Strong-Tie can make a variety of flat and bent steel shapes, which include gusset plates for heavy timber trusses, custom ornamental shapes and retaining plates.

MATERIAL: 3 gauge maximum

FINISH: Galvanized, textured powder-coated flat black, Simpson Strong-Tie® gray paint, stainless steel. Contact Simpson Strong-Tie for availability.

TO OBTAIN A QUOTE:

- · Supply a CAD drawing in .dxf format complete with plate dimensions, hole diameter and locations, steel thickness, desired finish (Simpson Strong-Tie Gray Paint, Black Powder-Coat, HDG or raw steel).
- Total plate shape and size up to maximum dimensions of 48"x48" (approx. 1/16" tolerance).
- Simpson Strong-Tie does not provide product engineering or load values for Special Order Plates.
- · Contact Simpson Strong-Tie for pricing information.
- Refer to General Notes, note a on page 13 for additional information.

"W" and "H" indicate the envelope size of the steel shape.

Typical Installation (Plate shown has black powder-coat)

SIMPSON Strong-Tie

CONCEALED JOIST TIES

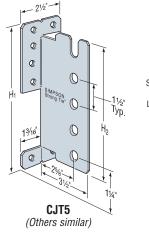

The CJT is a concealed connector. It can be installed three ways: with no routing of header/post or beam; a routed header/post, or a routed beam.

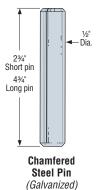

MATERIAL: 12 gauge **FINISH**: Galvanized **INSTALLATION**: • Use all specified fasteners.

- See General Notes.
- The CJT Pack is supplied with all pins and screws required. Screws require a hex head driver.
- · Router end of beam for screw heads for flush installation.
- The joist/beam may be sloped to 45° with full table loads.
- To provide maximum beam width for use with short pins, center in beam.
- To order: specify short (e.g. CJT3S) or long pins (e.g. CJT3L) (see footnote #1 below).

OPTIONS: See technical bulletin T-CJT (see page 191 for details).

CODES: See page 12 for Code Reference Key Chart.

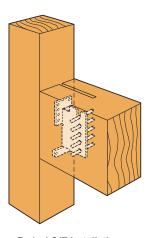

WARNING:

This connector requires special attention to ensure correct installation. The beam must be installed perpendicular to the support member. The connection's components may be damaged if the beam is rotated from its opposite end during or after installation. Damaged components may not be noticeable and may reduce the connector's load carrying capacity.

ORNAMENTAL – JOIST HANGER

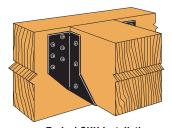

The OHU Ornamental Joist Hangers are heavy duty, load-rated joist hangers that are attached with Simpson Strong-Tie® Strong-Drive® ½"x3" double-barrier coating wood screws (SDS) (supplied with product).

MATERIAL: 12 gauge

FINISH: Textured powder-coated flat black paint.

OPTIONS: No modifications.

Typical OHU Installation

- Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- Allowable loads are based on parallel-to-grain loading and a minimum member thickness of 3½ with machine bolts in single shear. Straps must be centered about splice joint and bolt edge distances must meet NDS minimum requirements.
- Designer must determine allowable loads when combining bolts parallel and perpendicular to grain.

- Load values allowed assume a carrying member of not less than 3½°.
 Roof loads are 125% of floor loads unless a limited by other criteria.
 Floor loads may be adjusted for other load durations according to the code provided they do not exceed those in the roof column.
- Additional glulam beam widths are available. Add an "X" to the name and specify width, i.e. OU68X, W = 5.25
- 4. Skew and slope options not available.

STANDOFF BASES

The PBV is a hidden standoff post base. Two different sizes fit a variety of posts shapes.

MATERIAL: 14 gauge galvanized steel

FINISH: Textured powder-coated flat black paint or galvanized

ORDER: For powder-coated flat black, order PBV6PC or PBV10PC. For galvanized coating, order PBV6 or PBV10.

For kit containing Simpson Strong-Tie® Strong-Drive® screws (SDS), RFB bolt, SET 1.7 adhesive, and powder-coated PBV, order PBV6KT or PBV10KT.

The CPS is a Composite Plastic Standoff designed for increased concrete surface area.

MATERIAL: Engineered composite plastic

INSTALLATION: PBV and CPS

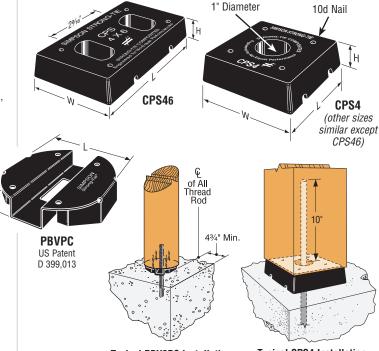

Post:

- Drill a 3/4" diameter hole, 10" into the center of the post.
- Clean out dust. Fill hole halfway with Simpson Strong-Tie[®] SET Epoxy-Tie® adhesive.
- Insert all-thread rod and allow epoxy to set and cure.
 Secure standoff to post using four 10d nails except PBV which uses four Simpson Strong-Tie SDS screws.

Concrete:

- Drill a 3/4" diameter hole per anchor design (see footnote 2 below).
- Clean out dust. Fill hole halfway with Simpson Strong-Tie SET Epoxy-Tie adhesive. Insert post subassembly into hole and allow epoxy to set and cure.
- · Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations (such as fences or unbraced carports).

CODES: See page 12 for Code Reference Key Chart.

- 1. Allowable uplift load capacities are for solid sawn posts with specific gravity of 0.36 minimum except the PBV, which is based on round "Viga" (Ponderosa Pine) wood posts.
- 2. All allowable uplift loads are based on a lowest ultimate load from testing divided by a reduction factor of 4. Concrete anchorage to be designed by others, refer to Simpson Strong-Tie® Anchoring and Fastening Systems for Concrete and Masonry catalog (form C-SAS, see page 191 for details). Allowable uplift capacities shall not exceed those shown in the table.
- 3. Download capacities are calculated based on the standoff bearing area and a concrete strength of 2500 psi except the PBV, which is based on the wood bearing strength (700 psi for Ponderosa Pine).

Dimensions | Dolto (Total) | Allowable Loads | a .

- 4. Allowable loads may not be increased for short term loading.
- 5. **NAILS:** 10d = 0.148" dia. x 3" long.

See page 16-17 for other nail sizes and information.

HL – HEAVY ANGLES & GUSSETS

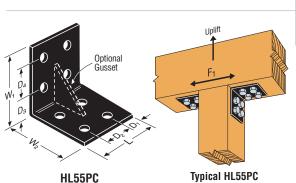

Versatile angle gussets and heavy angles promote standardization and construction economy, and are compatible with Simpson Strong-Tie® structural hardware.

FINISH: Textured powder-coated flat black paint, Simpson Strong-Tie® gray paint and also available galvanized

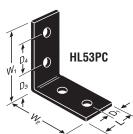

TO ORDER: All products with PC suffix are textured powdercoated flat black paint. 7 gauge products without the PC suffix are galvanized. 3 gauge products without the PC suffix are Simpson Strong-Tie gray paint.

OPTIONS: Gussets may be added to HL models when $L \ge 5$ " Specify G after numbers in model number as in HL46GPC.

CODES: See page 12 for Code Reference Key Chart.

- 1. Allowable loads have been increased 60% for wind or earthquake loading with no further increase allowed; reduce where other loads govern.
- 2. Use 0.85 times table load for Hem Fir.
- Parts should be centered on the face of the member to which they are attached. Wood members for the '3' and '5' series must have a
- minimum width and thickness of 3½" for table loads to apply.
- Wood members for the '4' and '7' series must have a minimum width and thickness of 51/8" for table loads to apply
- Parts must be used in pairs. Lag bolts of equal diameter (minimum 5" long) may be substituted for machine bolts into beam with no reduction in load

HANGER OPTIONS GENERAL NOTES

HANGER MODIFICATION OPTIONS AND APPLICATIONS

The Hanger Options Matrix for Face Mount and Top Flange Hangers on pages 182-183 shows hanger modifications and special applications (uplift, nailers and weldability) that are available for each model series. Modifications may not be available for all models in the series, and some combinations of hanger options are not available. Many hanger modifications result in load reductions. For all modifications, refer to the listed hanger option pages for additional information regarding the availability of each modification, associated load reductions, and installation requirements. For more information regarding the applications, refer to the individual product pages throughout the catalog.

HANGER OPTIONS GENERAL NOTES

This information applies only to the hangers manufactured by Simpson Strong-Tie and installed per our instructions. Some combinations of these options on a single hanger have not been evaluated. In some cases, combinations of these options cannot be manufactured. A qualified Designer must always evaluate each connection, including header and joist limitations, before specifying the product.

Testing is performed using a standardized hanger test method. The joist in the test setup may include the minimum amount of structural stability where appropriate. For example, the sloped down hanger tests are assembled with a joist cut on the lower end to lie flush with a wood member attached with three 8d common toenails. Header and other attached structural members are assumed fixed in actual installations. Horizontal loads induced by sloped joists must be resisted by other members in the structural system.

MATERIAL: Gauge may vary from that specified depending on the manufacturing process used. U, HU, HUTF, W and B hangers normally have single-piece stirrups; occasionally, the seat may be welded. Hanger configurations, height and fastener schedules may vary from the tables depending on the joist size, skew and slope.

FINISH: See specific hanger tables. Welded specials: Simpson Strong-Tie® gray paint.

Specials that are not galvanized before fabrication can be hot-dip galvanized after fabrication; specify HDG.

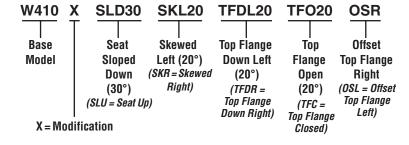

CODES: Modified hangers, due to their numerous variations, are not on code reports.

LOADS: For multiple options on the same connector, use the smallest reduction factor to give the lowest design loads.

TO ORDER: Use the abbreviations below to order specials. The example shows a W410 hanger and illustrates most available options; most special hangers have only a few of these features. For assistance, contact Simpson Strong-Tie.

·NOITA I IATON·

- Fastener quantities may be increased beyond the amount specified in the standard hanger table.
- Fill all holes with the table-specified fastener types.
- Some skewed hangers require bevel cut joists; refer to the specific notes provided for each product.

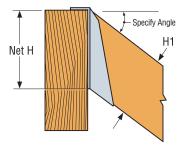

HEIGHT FOR SLOPED HANGERS

Height 1 (H1) is the joist height before the slope cut has been made.

Net Height (Net H) is the joist height after the slope cut has been made.

Provide **H1** when ordering a connector. Connectors are made assuming dry lumber is being used in continuously dry conditions.

Simpson Strong-Tie will calculate the **Net H** dimension based on the mathematical formula of H1/cos angle.

SIMPSON

U/HU

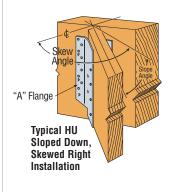

See Hanger Options General Notes. Not all slope and skew combinations are available.

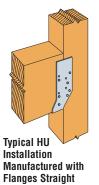

SLOPED AND/OR SKEWED

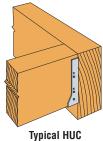

- For low-cost, code-reported 45° skews, see SUR/SUL and HSUR/HSUL. See also LSU/LSSU connectors.
- · These options only apply to wood-to-wood connections.
- U/HU may be skewed to a maximum of 45° and sloped to a maximum of 45°. Hangers 51/2" or less in width may be skewed to 671/2°. Hangers skewed 51°- 67½° require a square cut.
- For all options, uplift loads are 0.75 of table loads.
- For combined slopes and skews, the maximum allowable download is 0.80 of the table load.
- For skewed hangers 39/16" and less in width, the allowable download is 100% of the table load. For skewed hangers over 39/16" in width the allowable download is 80% of the table load. For slope only, the allowable download is 100% of the table load.

STRAIGHT OR CONCEALED FLANGE

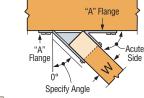

- HU is available with the A flanges straight at 100% of the table loads if $W \ge 3\frac{1}{2}$ ".
- If W < 3", use N10 nails at 0.64 of the table load.
- If $W \ge 3$ ", use 10d nails at 0.84 of the table load.
- HU is available with A flanges concealed, provided the W dimension is 25/16" or greater, at 100% of the table load. Specify HUC.
- . HU is available with one flange concealed when the W dimension is less than 25/16" at 100% of the table load.
- For skewed only HUC hangers, the flange on the acute side can be concealed at 100% of the table load. See table for skew limitations.
- · For sloped only hangers, flanges can be concealed at 100% of the table load.
- For sloped and skewed hangers, the flange on the acute side can be concealed at 0.80 of the table load. Contact Simpson Strong-Tie for skew limitations.
- · When nailing into the carrying member's end grain, the allowable load is 0.67 of the table load.
- For welding see technical bulletin T-HUHUC-W (see page 190 for details).

35/16"	39°
3%6"	42°
41/8"	42°
4%2 ["]	42°

1. Widths greater than 49/32" maximum skew is 45°.

LGU/MGU/HGU/HHGU/LGUM/HGUM

See Hanger Options General Notes.

CONCEALED FLANGE

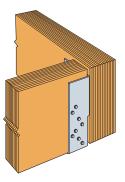

LGU, MGU, HGU, HHGU and HGUM hangers are available with one flange concealed. Order as an "X" version and specify flange to conceal. Example: LGU3.25X, Right flange concealed.

Allowable Loads for One Flange Concealed Option:

- LGU Series = 1.00 of table load
- HGU Series = 0.75 of table load
- MGU Series = 0.88 of table load
- HHGU Series = 0.75 of table load
- HGUM = contact Simpson Strong-Tie

Note: MGU3.63, MGU5.25 and HGU5.25 can not be concealed.

- LGUM and HGUM hangers are available skewed at 45°. Contact Simpson Strong-Tie for allowable loads.
- LGU, MGU, HGU and HHGU are not available in skew options.

Typical GU Installation with Right Flange Concealed

HANGER OPTIONS

HTU

See Hanger Options General Notes. **SKEWED SEAT**

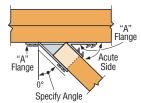

- Skewable up to 671/2°.
- Available in single and 2-ply size.
- . No bevel cut required.

- 1. Uplift loads have been increased 60% for wind or earthquake loading with

- no further increase allowed; reduce where other loads govern. Allowable downloads may not be increased. Maximum hanger gap between end of joist (*truss*) and face of carrying member is $\frac{1}{2}$ ". NAILS: $\frac{1}{2}$ = 0.162" dia. x $\frac{3}{2}$ " long, $\frac{1}{2}$ = 0.148" dia. x $\frac{1}{2}$ " long, 10d = 0.148" dia. x 3" long.

Top View HTU Hanger Skewed Right < 51°

Top View HTU Hanger Skewed Right ≥ 51°

HGUS/HHUS

See Hanger Options General Notes.

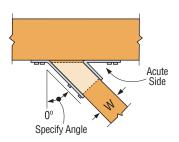

HHUS - SLOPED AND/OR SKEWED SEAT

- HHUS hangers can be skewed to a maximum of 45° and/or sloped to a maximum of 45°.
- For skew only, maximum allowable download is 0.85 of the table load.
- For sloped only or sloped and skewed hangers, the maximum allowable download is 0.65 of the table load.
- Uplift loads for sloped/skewed conditions are 0.72 of the table load, not to exceed 2475 lbs.
- The joist must be bevel-cut to allow for double shear nailing.

HGUS - SKEWED SEAT

• HGUS hangers can be skewed only to a maximum of 45°. Allowable loads are:

HGUS Seat Width	Joist	Down Load	Uplift
W < 2"	bevel or square cut	0.62 of table load	0.46 of table load
2" < W < 6"	bevel cut	0.67 of table load	0.41 of table load
2" < W < 6"	square cut	0.46 of table load	0.41 of table load
W > 6"	bevel cut	0.40 of table load	0.41 of table load

Top View HHUS Hanger Skewed Right (joist must be bevel cut) All joist nails installed on the outside angle (non-acute side).

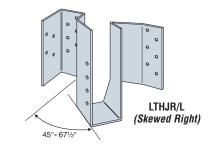

LTHJR/L

See Hanger Options General Notes.

SLOPE AND/OR SKEW

- Available in hip slopes up to 45° and/or skews left or right from 46° to 67°.
- For optional configurations, loads are 100% of table loads.
- To order specify:
- slope direction and degree and/or
- skew direction and degree.

Example: To order an LTHJR sloped down 45° and skewed right 55°, order an LTHJRX SLD45 SKR55.

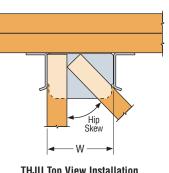

THJU

See Hanger Options General Notes. HANGER WIDTHS

- . THJU is available in intermediate seat widths between 51/8" (THJU26 width) and 71/8" (THJU26-W width).
- · Allowable download and uplift for all intermediate widths is 100% of the THJU26-W table loads.
- For double hip installation, divide the total allowable load by 2 to determine the allowable load for each hip.
- Order as THJU26X and specify width: see table for reference.

THJU Intermediate Width Options

Carried Member Combination	Hip Skew	Width (W)
2-Ply Hip and Single-Ply Jack	45-degree	6%

THGQH4 SK45	13	2x10	40-SDS 1/4"x6"	18-SDS ¼"x6"	3180	13990	

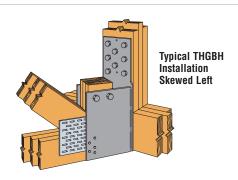

THGB/THGBH

See Hanger Options General Notes.

SKEWED SEAT

- THGB/THGBH hangers can be skewed to a maximum of 45°.
- The maximum allowable down load and uplift load for skew is 0.87 of the table load.

GLT/HGLT/GLS/HGLS/GLTV/HGLTV

See Hanger Options General Notes.

INSTALLATION: • Bevel-cut the carried beam for skewed hangers.

HANGER HEIGHT

• For hangers exceeding the joist height by ½", allowable load is 50% of the table roof load.

SLOPED AND/OR SKEWED SEAT

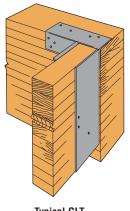

- GLT/GLTV/HGLT/HGLTV and GLS/HGLS series may be skewed to a maximum of 50° or sloped to a maximum of 45°.
- For skews greater than 15°, multiply the table uplift load by 0.50.
- For sloped only, the maximum allowable load is 6500 lbs. for the GLT/GLS/GLTV, 9165 lbs. for the HGLT/HGLS/HGLTV.
- For skewed only, the maximum allowable load is 6550 lbs. for the GLT/GLS/GLTV, 7980 lbs. for the HGLT/HGLS/HGLTV. The deflection at full loading may reach 1/4".
- Sloped and skewed GLT/GLS/GLTV configurations have a maximum allowable load of 5500 lbs.
 Sloped and skewed combinations are not allowed for the HGLT/HGLS/HGLTV.
- Sloped and/or skewed seat hangers may not be installed in non-backed nailer/header installations.

SLOPED TOP FLANGE

 A top flange may be sloped down left or down right to 30° with or without a sloped and/or skewed seat (see illustration). Reduce allowable table loads using straight-line interpolation (see page 188).

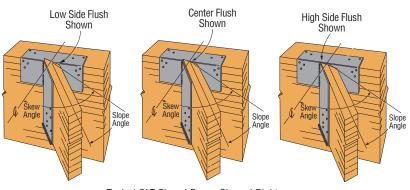

OFFSET TOP FLANGE

- The top flange may be offset left or right for placement at the end of a header. Minimum seat width 3¼". The maximum allowable load is 0.50 of the table roof load for the GLT/GLS/GLTV, and 0.45 for the HGLT/HGLS/HGLTV.
- For skewed and offset top flange hangers, the maximum allowable load is 3500 lbs.
- No uplift load.

Typical GLT Top Flange Offset Left (HGLT similar)

Typical GLT Sloped Down, Skewed Right When ordering, specify Low Side Flush, Center Flush or High Side Flush

Hanger Option

HANGER OPTIONS

SIMPSON Strong-Tie

B/LBV/HB/HHB/GB/HGB

See Hanger Options General Notes.

MATERIAL:

 Gauge may vary from that specified depending on the manufacturing process used. Hanger configurations, height and fastener schedules may vary from the tables depending on the joist size, skew and slope.

CODES:

 Modified hangers, due to their numerous variations, are not in code reports.

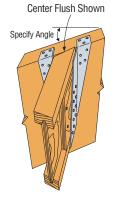

LOADS:

 For multiple modifications on the same connector, use the single multiplier factor that yields the lowest design loads.

INSTALLATION:

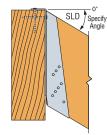

- Fastener quantities will typically increase beyond the amount specified in the standard hanger tables.
- Web stiffeners are required for I-joists.
- Fill all holes with the table-specified fastener types.
- Bevel cut the carried member for skewed applications.
- Sloped B, HB and LBV hangers less than 14" are assumed backed. For non-backed installations, contact Simpson Strong-Tie.

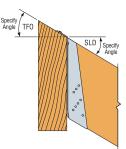

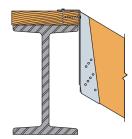

B Hanger Sloped Down and Skewed Left with Sloped Top Flange Installation When ordering, specify Low Side Flush, Center Flush or High Side Flush

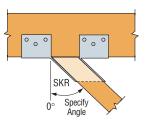

Typical LBV Sloped Down with Top Flange Open

Saddle Installation

SADDLE HANGER

Saddle hangers are made to order; add "D" to model (e.g. BD412); specify S (for saddle) dimension. They may be used for most conditions except at end wall locations and are preferred for nailer applications. Minimum S dimension (saddle width) is 3%/e". Minimum supporting member width is 3½". Minimum nailer thickness apply (see page 69 and 92). Saddle hangers achieve catalog load listed. Saddle hangers on stud walls do not achieve catalog loads.

- Use this table to calculate allowable loads for modified hangers. Apply reduction factor to the appropriate allowable load for the header condition, including nailers.
- condition, including nailers.

 2. HB Hangers less than 2½"
 wide are assumed to use
 10dx1½" joist nails. HB
 Hangers 2½" and wider are
 assumed to use 16dx2½"
 joist nails.
- 3. Minimum height for TF
 Opened/Closed is 14" when
 combined with any skew.
 Minimum height for TF
 Opened/Closed combined
 with slope only is the same
 as listed for slope only.
- 4. For sloped and skewed LBV hangers less than 14" allowable uplift shall be limited to 190 lbs.
- 5. For LBV Hangers with a modified top flange allowable uplift shall be limited to 240 lbs. when using 2-10dx1½" joist nails.
- For B and HB hangers less than 14" allowable uplift shall be limited to 480 lbs.
- 7. For HB hangers less than 14" use 4-16d or 16dx2½" joist nails. Allowable uplift shall be limited to 615 lbs.
- 8. These hangers may deflect an additional 1/32" at design load.
- 9. For HB hangers on nailers, 100% of allowable nailer uplift value may be used. (See nailer table)
- For hangers with slope and skew less than 14" use 1150 lbs. for B hangers and 1430 lbs. for HB hangers.
- 11. In the table the term "x" refers to the angle of the modification.

SIMPSON Strong-Tie

HANGER OPTIONS

W/WNP/WNPU/WP/WPU/HW/HWU

See Hanger Options General Notes.

Models that have an "i" in the model number (e.g., HWI) have the same properties and modifications as the standard models without the "i" in the

INSTALLATION: • Some models are available in Type A (Bevel Cut) and Type B (Square Cut) styles; all models are available in Type B style. Contact Simpson Strong-Tie when ordering.

 Bevel-cut the joist for skewed Type A hangers (see illustration). Butt-cut the joist for Type B hangers.

 Hangers with a skew greater than 15° may have all the joist nails on the outside angle.

Skewed HWs have face nails and require a minimum header depth of 3½".

HANGER HEIGHT

For hanger heights exceeding the joist height by more than $\frac{1}{2}$, the allowable load is 0.50 of the table load.

SLOPED AND/OR SKEWED SEAT

- Non-skewed hangers can carry the design load when the seat slope is within 1/4:12 of the joist slope. Designer must check that wood bearing is not limiting.
- W/WNP/WP/HW series may be skewed to a maximum of 84° and/or sloped to a maximum of 45°
- For slope only, skew only, or slope and skew combinations, the allowable load is 100% of the table load.
- · Sloped seat hangers are assumed backed. For non-backed installations, specify "non-backed", which adds more joist fasteners low on the joist flange. UPLIFT LOADS (WPU, WNPU, HWU only)

- Uplift loads not available on W, WNP, WP, HW hangers. See page 190 for WMU.
- Hangers can be sloped to 45° and/or skewed 45° at 100% of the uplift load.
- Skew option is only on hangers with "W" 3%16" or less.
- Specify the slope up or down in degrees from the horizontal plane and/or the skew right or left in degrees from the perpendicular vertical plane. Specify whether low side, high side or center of joist will be flush with the top of the header (see illustration).
- Uplift loads are not available for open/closed TF, TF sloped, and offset options.

SLOPED TOP FLANGE

 A top flange may be ordered sloped down left or down right to 35° with or without a sloped and/or skewed seat (see illustration). Reduce allowable table loads using straight-line interpolation Example: For a top flange sloped down 30°, reduce load to [(90-30)/90] x table load.

OFFSET TOP FLANGE

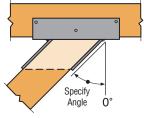

- The top flange may be offset left or right for placement at the end of a header (see illustration). The allowable load is 0.50 of the table load.
 For skewed and offset top flange hangers, the maximum allowable load is 0.50 of the table load or 2000 lbs., whichever is lower.
 For type B hangers skewed and top flange offset in the opposite direction, hangers 3½ and less wide have allowable load of 25% of the table load or 1335 lbs. whichever is lower, and for hangers wider than 3½, the allowable load is 30% of the table load or 1620 lbs. whichever is lower.

OPEN/CLOSED TOP FLANGE

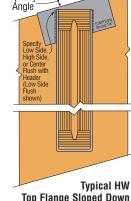

• The top flange may be opened more or closed less than the standard 90° (see illustration) to a maximum of 30°, except the HW which cannot be closed. W and WI hangers must use 10dx1½" nails for closed application. Reduce allowable loads using straight-line interpolation (see sloped top flange).

SADDLE HANGER

- To order, add D to model and specify S dimension (see illustration). RIDGE HANGER (not available for uplift models)
 - Top flange may be sloped to a maximum of 35° to accommodate a ridge (see illustration). Specify angle of the slope. Reduce allowable load using straight-line interpolation. See Open/Closed example.
 - Recommended S dimension is 1/16" oversized for carrying members 2½" wide and less or 1/8" oversized for greater than 2½" wide.

HANGER OPTIONS

LEG/MEG/EG

See Hanger Options General Notes.

SKEWED SEAT — TOP FLANGE MODELS ONLY

• The LEG/MEG/EG series can be skewed up to 45°. The maximum allowable load is 10,000 lbs. for LEG and MEG, 14,250 lbs. for EG.

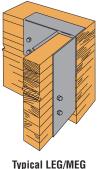

SLOPED SEAT — TOP FLANGE MODELS ONLY

• The LEG/MEG/EG series can be sloped up to 45°. The maximum allowable load is 9665 lbs.; see illustration.

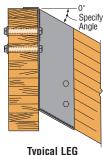

NO SLOPED AND SKEWED COMBO AVAILABLE.

OFFSET TOP FLANGE

- . The LEG/MEG (only) top flange may be offset left or right for placement at the end of a header (see illustration). The maximum allowable load is 5665 lbs. (Min. H = 11'' for MEG, 9" for LEG)
- No skews allowed on offset hangers.

Sloped Down Installation (MEG/EG similar)

EGO

See Hanger Options General Notes.

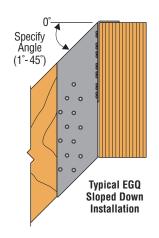

SKEWED SEAT

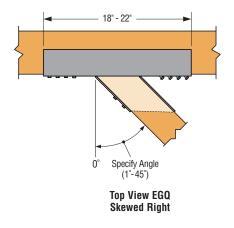

- The EGQ can be skewed a maximum of 45°.
- The maximum allowable download when skewed is 16,300 lbs.
- The maximum allowable uplift when skewed is 5770 lbs.
- · Joist must be bevel cut for skewed seat installation.

SLOPED SEAT

- The EGQ can be sloped up or down a maximum of 45°.
- The maximum allowable download when sloped is 15360 lbs.
- The allowable uplift when sloped is 100% of the table load.
- · Sloped seat installation requires an additional 14 joist screws (supplied with the connector).

NO SLOPED AND SKEWED COMBO AVAILABLE.

HUTF/HUITF

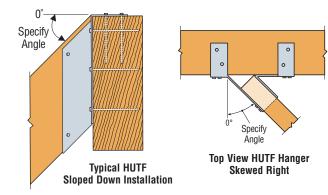

See Hanger Options General Notes.

SLOPED AND/OR SKEWED SEAT

- HUTF can be skewed to a maximum of 45° or sloped to a maximum of 45°. HUTF can be skewed and sloped down only, provided $W \ge 2\%$ ". Hangers with a skew greater than 15° may have all the joist nailing on the outside angle. No skew with slope up options available.
- For the skewed-only HU34TF, HU24-2TF and HU44TF, the allowable loads are 0.50 of the table load. All other models have a maximum allowable load of 0.60 of the table loads.
- For skews greater than 15°, uplift loads are 0.75 of the table loads.
- For sloped and skewed hangers, the allowable loads are 0.70 of the table loads.
- For sloped down only hangers, allowable load is 0.78 of the table load.

CONCEALED FLANGE

• HUTF is available with one A flange concealed at 0.85 of the catalog table load. HUTF is also available with both flanges concealed provided the W dimension is 29/16" or greater, at 0.85 of the table load. Specify HUCTF for both flanges concealed. No skew options available.

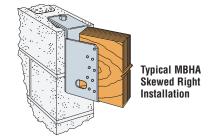

SIMPSON Strong-Tie

MBHA

See Hanger Options General Notes.

SKEWED SEAT

 Seat can be skewed at 45° only. The maximum allowable download is 3495 lbs. and 1585 lbs. uplift for Height 7½". For all other models, use the table listed download and uplift of 2390 lbs.

WM/WMI/WMU

See Hanger Options General Notes.

INSTALLATION: • Bevel-cut the joist for skewed hangers (see illustration). HANGER HEIGHT

 For hanger heights exceeding the joist height, the allowable load is 0.50 of the table load.

SLOPED AND/OR SKEWED SEAT

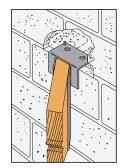

- WM/WMI may be skewed and/or sloped to 45° maximum.
- The allowable load is 100% of the table load.

OFFSET TOP FLANGE

 The top flange may be offset left or right for placement at the end of a header. The allowable load is 0.50 of the table roof load.

UPLIFT (WMU Only)

. No modifications on WMU.

Typical WM Sloped Down, Skewed Right Block Wall Installation

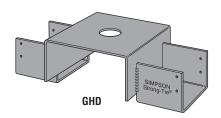

Typical WM Top Flange Offset Left

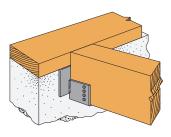

GH Girder Hanger

See Hanger Options General Notes.

SKEWED SEAT

- GH hangers may be skewed to a maximum of 45°; bevel cut required.
- The allowable loads are 100% of the table load.
- Specify GHD for saddle-style hangers. GHD may not be skewed.

Typical GH Installation Skewed Right

LITERATURE REFERENCE

Simpson Strong-Tie maintains an extensive library of literature, providing information on a wide variety of subjects ranging from specific product lines and alternate product installations to industry issues and specifier guides.

Below is a list of the literature referenced in this catalog. You can access the complete library by visiting **www.strongtie.com** or you can call 800-999-5099 and have publications mailed to you.

FORM NUMBER	DESCRIPTION
C-APG	Architectural Product Group catalog
C-ATS	Anchor Tiedown Systems catalog
C-CFS	Connectors for Cold-Formed Steel Construction
C-QD	Quik Drive® Systems catalog
C-SAS	Anchoring and Fastening Systems for Concrete and Masonry
C-SW	Strong-Wall® Shearwalls catalog
F-DECKSPCR	Deck Spacer™ deck board spacers
F-EZFPP	E-Z fence post products
F-FSC	Floor span connector (information on installation on offset studs)
F-FWAZ	Foundation Wall Anchor
F-ICFVL	Additional connection details for connectors used with Insulated Concrete Forms
F-PLANS	Seismic retrofit guide helps educate how earthquakes affect a home and the steps to take to reinforce the structural frame of a house
F-RBC	Application and specification information for the Roof Boundary Clip
F-REPRPROTECT	Code Compliant Repair and Protection guide for the installation of utilities in wood frame construction
F-RUZNRUZ	RUZ and NRUZ retrofit hangers for panelized roof construction
F-SAS-THD4HD	Titen HD® anchors for holdowns
F-THGBV	THGB/THGBH/THGW hangers in LVL widths
S-INSTALL	Field guide for proper installation various of Simpson Strong-Tie® connectors
T-AIRNAIL	Provides information regarding installations with EZ CODE™ fasteners by the Air Nail Company
T-ANCHORSPEC	Simpson Strong-Tie Anchor Systems® specifications for use with Simpson Strong-Tie® connectors
T-ANSITPIDF	ANSI/TPI allowable loads for Douglas Fir lumber
T-ANSITPISP	ANSI/TPI allowable loads for Southern Pine lumber
T-ANSITPISPF	ANSI/TPI allowable loads for Spruce-Pine-Fir lumber
T-BOSTITCH	·
T-CCLTC-WS	Provides information regarding installations with Bostitch Metal Connector Fasteners Worksheet for ordering custom multiple beam column caps
T-CCQLTC-WS T-CJT	Worksheet for ordering custom multiple beam column caps Concealed Joist Tie Kit
T-CMST T-HCAGUIDE	Coil strap alternative nailing schedule and Lap Splice Spacing
	Hinge connector specifier guide
T-HD-LA T-HD2AGRDRL	City of L.A. RR values for holdowns HD2A holdowns for deck guardrail applications
T-HFHANGER	HF24N and HF26N panelized roof hangers
T-HTIEBEARING	Allowable bearing enhancement loads for selected hurricane ties
T-HUHUC-W	HU and HUC hangers welded to steel members
T-HUHUCTTN	HU and HUC allowable loads with Titen® screws in masonry
T-MASSW	MAS anchors for shearwalls in seismic regions
T-MSC-WS	Multiple Seat Connector (MSC) special order worksheet
T-NAILERUPLFT	Uplift design loads for top flange hangers installed on nailers or I-beams
T-NAILGUIDE	Correct nails for use with Simpson Strong-Tie® connectors
T-OPTUPLIFT	Alternate uplift options for IUS, IUT and ITT hangers
T-PAUPLIFT	PA foundation straps for uplift resistance
T-PLYWOOD	HPAHD22 and STHD Holdowns installed over Shearwall Diaphragm
T-PNEUMATIC	Refer to T-AIRNAIL, T-BOSTITCH, T-POSITIVENL, and T-TRUESPECHAL
T-POSITIVENL	Provides information regarding installations with Positive Placement fasteners by Paslode
T-PTBARRIER	Using a membrane barrier with preservative-treated wood for additional corrosion protection
T-PTW00D	Corrosion issues related to the use of new chemicals in preservative-treated wood
T-RBCP	RBCP pre-attached to truss blocking
T-REDHEEL	Allowable loads for reduced truss heel heights
T-RIMBDHGR	Joist hangers on rim board headers
T-SCLCOLUMN	Descriptions of various SCL posts and associated loads listed by product category
T-SDSCREWAPPS	SDS screws to attach multi-ply members
T-SLOPEJST	The effects on load values caused by installing a sloped joist into a non-sloped hanger
T-STRAPS	LSTA24 and MSTA24 field formed as a stud to mudsill anchor
T-TRUESPECHAL	Provides information regarding installations with Halsteel Fasteners using the Truespec™ Nail Identification System
T-WELDUPLFT	Top flange hanger welded to structural steel members
T-WT	Wedge Tie Spacing
•	,

NOTES

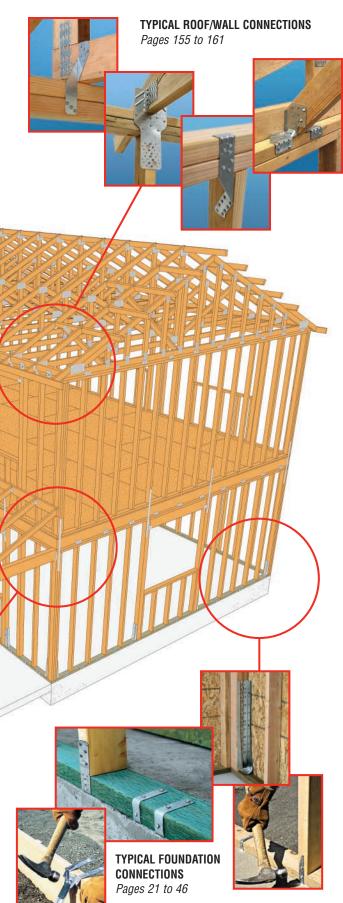

CONTINUOUS LOAD TRANSFER PATH

This drawing shows the connection points for a continuous load transfer path from the rafters to the foundation of a two-story house.

Building with a continuous load path is an essential part of creating a structure better able to withstand the forces of mother nature.

This drawing is for illustrative purposes only and should not be considered an engineered system. Refer to the page numbers for the full range of Simpson Strong-Tie® connectors. Consult a qualified Designer to ensure that correct connector quantities and installation methods are used to achieve the full design load values.

Anchoring and Fastening Systems for Concrete and Masonry*

Includes application information, specifications and load values for adhesive and mechanical anchors, P.A.T. and carbide drill bits.

*Available in English and Spanish versions.

High Wind-Resistant Structural Connectors

For builders and homeowners on retrofitting and new construction in high wind areas.

Anchor Tiedown Systems

This system is designed to provide the over-turning holdown capacity for multi-story commercial buildings. This holdown application is easy to specify, install and inspect.

Strong-Wall® Shearwalls

All the information on our Strong-Wall shearwalls is now in one easy to use catalog: technical data, installation information, structural details and more. The catalog also features new solutions for two-story and balloon frame applications as well as an extensive section on braced frame requirements under the various building codes.

Cold-Formed Steel Connectors Catalog

30 products have been developed and tested using screw fasteners to obtain actual load values. Includes installation requirements and illustrations.

Deck Framing Connection Guide

Developed for deck building professionals and general contractors to help explain products and techniques used in designing and constructing residential decks.

Anchoring Solutions for Simpson Strong-Tie Connectors Catalog

Simpson Strong-Tie Anchor Systems® specifications with our connector line. It should be used in conjunction with the current connector and anchor systems catalogs.

High Wind Framing Connection Guide

Developed for designers and engineers as a companion to the AF and PA Wood Frame Construction Manual.

Stainless-Steel Connectors

Featuring stainless-steel connectors for using in high exposure and some outdoor environments to protect against corrosion and some preservative-treated woods.

Simpson Strong-Tie Free CD-ROM

Our CD-ROM features our latest catalogs, fliers, technical bulletins, code reports, product list prices, UPC information, and the Simpson Strong-Tie Connector Selector program. It also includes the Drawing Library.

In addition to the publications shown above, Simpson Strong-Tie maintains an extensive library of literature, providing information on a wide variety of subjects. You can access the library by visiting <code>www.strongtie.com/tech-bulletins</code> or you can call 800-999-5099 and have publications mailed to you.

SOFTWARE

Simpson Strong-Tie offers three software programs to simplify product selection and specification. Each of these programs is available on CD ROM or for free download at **www.strongtie.com**.

Connector Selector

The Connector Selector finds the products that are appropriate for your connection and sorts them by lowest installed cost. Solutions are available for a wide variety of applications using solid sawn lumber, engineered wood and structural composite lumber, glulam beams and wood trusses. Available in U.S. (Allowable Stress Design) and Canadian (Limit States Design) versions.

Strong-Wall Selector

The Strong-Wall Selector helps specifiers choose a lateral force resisting system using Wood or Steel Strong-Wall® Shearwalls. Optimized or Manual input provides the most cost effective solution or allows designers to choose and check whether any type and number of walls satisfy the shear load requirements.

ATS Selector

The ATS Selector recommends the correct ATS system components based upon load requirements and building code options input by the Designer. It can also recommend the corresponding compression post designs. Resulting calculations can be printed and AutoCAD drawings can be inserted into plans.

For assistance specifying post-installed anchors for concrete and masonry, visit **www.simpsonanchors.com** to download the Anchor Designer software. Two versions are available for allowable stress design and ultimate strength design, including cracked concrete.

This catalog reflects changes in the allowable loads and configurations of some Simpson Strong-Tie Company Inc. products. **This catalog is effective until December 31, 2010,** and supersedes all information in all earlier publications, including catalogs, brochures, fliers, technical bulletins, etc. Use this edition as a current printed reference. Information on allowable loads and configurations is updated annually.

We post our catalogs on www.strongtie.com. Please visit our site, and sign up for any information updates. Allowable loads in this catalog are for the described specific applications of properly-installed products. Product modifications, improper loading or installation procedures, or deviations from recommended applications will affect connector allowable load-carrying capacities.

Supporting You from the Ground Up

At Simpson Strong-Tie, we believe quality is not only about the products we produce, but about the experience and interactions our customers have with us. We work hard to provide value to all our customers whether they're specifying our product or installing it. That means providing things like **engineering support, training, product testing, job site visits** and **nationwide product availability**. These services are integral to how we do business with our customers.

In these tough economic times, we also believe it's very important to support the communities we live and work in, which is why for many years we've donated our time and products to Habitat for Humanity. Our local and national support is providing safe, affordable housing to people in need.

Simpson Strong-Tie is committed to supporting our customers and communities while delivering high-quality, innovative structural and fastening products. You've trusted us for more than 50 years, and we will continue to earn that trust.

Together We're Building Safer, Stronger Homes and Buildings

Every day we work hard to earn your business, blending the talents of our people with the quality of our products and services to exceed your expectations. This is our pledge to you.
