- Low Backlash
- Smooth Operation
- Greater Load Sharing
- Whisper Quiet

Output housing and helical internal gear are machined from a single piece of high strength steel

UltraTRUE™ in-line planetary gearhead

UltraTRUE 90™ right angle planetary gearhead

Helical gears are known for their quiet and smooth operation along with their ability to transmit higher loads than spur gears. Both of these features of helical gearing result from the improved contact ratio (effective teeth in mesh) over spur gears. Crowning is a modification to the gear tooth profile which optimizes gear mesh alignment. It also enhances distribution of loading on the tooth flank, thereby reducing high stress regions which can result in surface pitting.

Planetary gearheads are often selected for high precision motion control applications which require a high torque to volume ratio, high torsional stiffness and low backlash. Until now, these attributes have been sufficient to meet the requirements of the market. Danaher Motion has designed a high torque, whisper quiet helical gearhead to meet the recent improvements in servo motor technology.

Danaher Motion engineers accomplished this by combining the positive attributes of gear crowning and helical gearing with the planetary construction to create the smoothest operating gearhead on the market.

Spur vs. Helical Gearing

Typical contact ratio is 1.5 for spur gearing.

Contact ratio for equivalent helical gear is 3.3...more than double the contact ratio.

The Contact ratio is defined as the number of teeth in mesh at any given time. The higher the contact ratio, the higher the torque rating of the gearing. **Helical gearing has more than 2X the contact ratio of spur gearing.**

Crowned vs. Non-crowned

Crowning optimizes the gear mesh alignment within a gear train to increase the torque capacity and reduce noise. It also enhances load distribution on the tooth flank to reduce high stress regions.

PowerTRUE™ Right Angle Gearheads offer...

- Lower backlash accomplished through single axis mesh adjustment
- A compact right angle design utilizing a high-tech face gear
- Whisper quiet operation due to high contact ratio
- Mesh ratios from 1:1 to 5:1
- 98% efficiency

PowerTRUE™ Gear

Computerized mapping of gear tooth profile

CNC Machining of a PowerTRUE™ right angle gear

PowerTRUE™ right angle gearset

Right angle gear meshes are typically limited to ratios from 1:1 to 3:1 when using standard bevel gears. Compared to these designs, the PowerTRUE 90 gear increases the ratio range to 5:1.

The key to higher torque density is a unique tooth design, created by complex machining made practical with advanced CNC equipment and software. In the design, multiple teeth in the face gear simultaneously mesh with a standard involute pinion. The continuous tooth engagement yields a high contact ratio between the gear and the pinion, boosting torques to new levels and efficiency to 98%.

Advanced software enables stress analysis of PowerTRUE tooth profile

RediMount™ Motor Mounting System

Mounting Instructions

1. Slide the provided sleeve into the hub and align the slot in the bushing with the slot in the hub.
2. Set the motor on a work surface or hold fixture with the output shaft facing straight up. If there is a key on the motor, remove it and align the keyway with the slot in the hub. Slide the gearhead down onto the motor shaft.
3. Rotate the hub to align the input housing access holes with the hub clamping bolts.
4. Using a torque wrench tighten the hub bolts to the pre-torque value indicated in the table.
5. Bolt the motor to the gearhead with the bolts provided.
6. Gradually tighten the hub bolts in three steps, increasing the torque each time until reaching the final tightening torque in the table.

Gearhead Selection

Step 1: Select the required precision class and gearhead configuration (in-line or right angle).

Step 2: Select the proper gearhead using exact or general method.

For continuous duty applications, please contact Applications Engineering.

General Method:

Required Gearhead Torque(T_r)

$$(1) T_r = T_M * i * e$$

where:

T_M = continuous torque of motor

i = Gearhead ratio

e = efficiency of Gearhead

* Since many motors are capable of exceeding their continuous torque rating for extended lengths of time, the value for T_M will only provide a starting point for Gearhead selection. Only use the general method if the continuous motor rating is not exceeded in the application.

Exact Method

Motion Profile

t_n = time period n

n_{nm} = mean speed during time period t_n

T_n = torque during time period t_n

Mean input speed (n_m)

$$(2) n_m = \frac{n_{1m}t_1 + n_{2m}t_2 + n_{3m}t_3 + \dots + n_{nm}t_n}{t_t}$$

where $t_t = t_1 + t_2 + t_3 + \dots + t_n$

Equivalent torque (T_{EQ})

$$(3) T_{EQ} = \sqrt[8.7]{\frac{T_1^{8.7} n_{1m} t_1 + T_2^{8.7} n_{2m} t_2 + T_3^{8.7} n_{3m} t_3 + \dots + T_n^{8.7} n_{nm} t_n}{n_m t_t}}$$

Modified equivalent torque (T_{EQm})

$$(4) T_{EQm} = (T_{EQ})/Q$$

where Q is:

Q	# of cycles/hr
1,0	>0
0,9	>1000
0,7	>2500
0,5	>5000

For > 10,000 cycles/hr please contact application engineering.

Ratio 5P is designed using only PowerTRUE face gearing technology.

Ratio 5T adds a True Planetary gearing stage for increased torque capacity.

¹ Ratios are exact, higher ratios and other custom options are also available, consult factory.

T_r = Rated output torque at rated speed for specific hours of life.

J = Mass moment of inertia reflected to the input shaft (including pinion assembly)

T_{peak} = Allowable momentary peak torque for emergency stop or heavy shock loading.

Ratio 5P is designed using only PowerTRUE face gearing technology.

Ratio 5T adds a True Planetary gearing stage for increased torque capacity.

¹ Ratios are exact, higher ratios are also available, consult factory.

T_r = Rated output torque at rated speed for specific hours of life.

J = Mass moment of inertia reflected to the input shaft (including pinion assembly)

T_{peak} = Allowable momentary peak torque for emergency stop or heavy shock loading.

Figure 2

Allowable Shaft Misalignment

The Micron AccuLOCK® Flexible Steel Bellows Coupling compensates radial, axial, and angular shaft misalignment (Figure 1). The maximum permissible* shaft alignments from this table must not be achieved simultaneously or exceed the maximum value. If there are several different misalignment simultaneously, they will influence each other as shown in Figure 2.

Integral In-line Gearmotors

A precision low noise, highly efficient gearhead is coupled together with an encoder and brush type permanent magnet DC motor to create a complete drive solution. The innovative material selection of the gearing greatly extends life, increases gearhead efficiency, and eliminates noise.

Thin Profile Gearbox

A parallel shaft spur and helical gearbox which is fully compatible with commonly available "pancake" style disc armature motors. The lightweight aluminum alloy housing encases the 150:1 ratio low noise gearing.

Custom Engineered Solutions

Spur Gear Differentials

Combining differential gearing technology with a position feedback sensor results in this highly sensitive assembly used on windpowered devices to adjust the pitch of the driving and wind vanes.

Integral Planetary Gearmotors

A more compact, higher torque drive assembly can be created by integrating a pinion gear directly on the motor shaft.
