The products have been organised according to applications and each group is organised in numerical order.

At the back of the catalogue you will find an index in numerical order.

#### Key to symbols

#### Article number

The article number must be followed by the colour code, e.g. 29154 Brush, red.

#### Bristlestype

#### Bristle length

Dimensions are stated in mm. The dimension is the visible filament length.

#### Brush length

Dimension is stated in mm. The dimension states the length of the piece with bristles.

#### Diameter of the hand grip

The dimensions stated are in mm, and indicate the diameter of the hand grip.

#### Dimension

All dimensions are stated in mm. Dimensions are stated as height x width x length or diameter (Ø) x length.

Weight is stated in kg. Product net weight is stated with 2 decimals.

Number of products packed in outer

#### Temperature

No. per carton

Temperatures stated are the temperatures tolerated by the products for cleaning. Temperatures are stated in Celcius (C) and Fahrenheit (F).

All materials are approved by FDA unless otherwise stated.

The following abbreviations are used: STS - Stainless Steel

ALU - Aluminium RF - Reinforced

PP / PPN - Polypropylene PBT / PET - Polyester

## conditions of importance to food safety. This certainly applies to hygiene.

Optimal food safety with the Vikan hygiene system®

Customers and authorities are making ever-increasing demands on companies in the food sector being able to document

Hygiene depends strongly on cleaning, which has to be much more than just efficient. It must also ensure that bacteria from one department are not moved to another department where they could spoil a finished product. These requirements are some of the reasons that we developed the Vikan hygiene system®.

This is the only programme within professional hygiene cleaning where efficiency, ergonomics, design and safety are integrated in the same product. Our development department has invested extensive resources in this task.

All products in the Vikan hygiene system® are available in five colours. Some are available in six. This means that Vikan's colour coding system can be used to improve hygiene within the company. By dividing the company into a maximum of six colour zones, you can prevent tools being moved from one department to another, therefore avoid transferring bacteria from one department to another.

In this concrete manner, the Vikan hygiene system® provides employees, customers and authorities with occular proof as regards visual quality control of hygiene. Now hygiene is not just measurable, but also visible with the naked eye.

In addition, there are cleaning tools for every conceivable purpose. The Vikan hygiene system® programme is the only complete range to cover all manual cleaning requirements. We call it Vikan Professional Cleaning Solutions because careful consideration has been given to every single detail throughout the entire process from development to the user application.

Choose cleaning tools from Vikan, and you will be assured of quality, long life and the best overall economy. All products are manufactured on the basis of raw materials complying with the U.S. Food and Drug Administration's strict quality

Vikan possesses ISO 9001 quality certification and ISO 14001 environmental certification.

Read more about the Vikan hygiene system® on our website www.vikan.com where you can also see how to introduce full colour coding control in your own company or department.

Yours sincerely

Hans R. Holst, Managing Director Vikan A/S

#### Colour codes

If the ordered product is requested in green, the article number must be followed by 2.

If the ordered product is requested in blue, the article number must be followed by 3. If the ordered product is requested in red,

the article number must be followed by 4. If the ordered product is requested in white, the article number must be followed by 5.

If the ordered product is requested in yellow, the article number must be followed by 6.

If the ordered product is requested in black, the article number must be followed by 9.

Vikan A/S has a quality assurance system whose object is to ensure that Vikan A/S's products always comply with specifications.

Vikan A/S has an environmental management system whose object is to ensure that Vikan A/S can guarantee our customers products made in an environmentally responsible manner.

## **Bacteria know no borders**

One of the biggest challenges facing food companies is how to avoid bacterial degradation of the quality of the food. If there is cross-contamination, where bacteria spread from one place in production to another, the result can be tainting of foods already finished. It is therefore important to have a system which will ensure hygiene and food safety.

#### Use colours to optimise cleaning

Vikan has developed a clear and simple colour coding system which makes it easier to optimise the company's hygiene. All tools are available in five colours, some in six. By using coloured cleaning tools in specifically defined departments or production sections, users are able to understand very quickly where the tools should be used. Therefore it is much easier to avoid tools being moved from one colour zone to another.

#### **Fully colour-coded tools**

This means that both filaments and the base are the same colour. The colour of each tool is clearer, minimising the possibility of error. In the event of accidents, traceability is extremely easy. The HACCP system considers cleaning to be a critical control point, and, in our experience, the HACCP system can be improved by optimum planning of cleaning. If the company already utilises the HACCP system, it is a good idea to supplement it with colour-coded cleaning tools.

#### There are several advantages

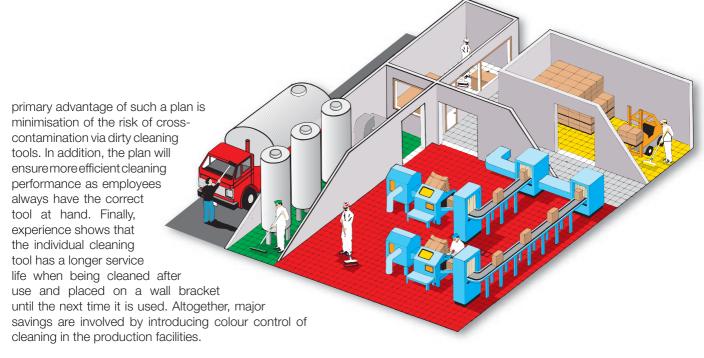

- Focus is placed on cleaning as a critical control point.
- Cleaning is made more efficient and more economical.
- The risk of cross-contamination is minimised.

#### **Vikan Colour Coding Application**

As an extra safety feature, we have developed a computer program for our distributors. The application enables them to create virtual layout of production rooms, which provides both an overview of the different colour zones of the company and also records the tools used in the different zones. The information is stored on the distributor's computer. Therefore the company responsible can easily change both cleaning methods and selection of tools if necessary. In this way, the documentation is right at hand, and print from the program can be stored directly in the HACCP folder.

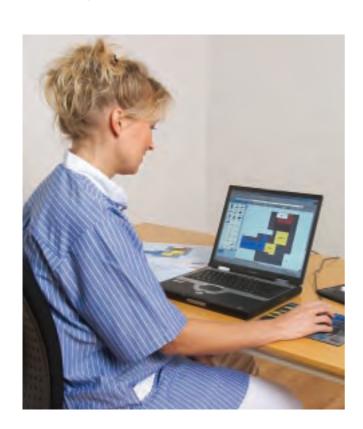

Now cleaning zones, colour codes and how to position the selected cleaning tools have been specified. The

Let our professional hygiene consultants review your production facilities. This will provide you with a clear and simple plan of cleaning and a review of the hygienic problems involved in connection with machines and equipment. On the basis of this review, you will receive our proposal for the correct cleaning tools. The result is a complete colour control with a plan of the production rooms and a specification of the cleaning tools to be used in each individual cleaning zone. If you wish, we will assist you with implementation of the plan and training of your employees in the tools and their use.

The Vikan hygiene system® will give you full control of hygiene and cleaning costs.

#### **Table & Floor Scraper**

0,35

Ø30x42

1/2" hose coupling fits between 1/2" hose and quick coupling. Max pressure 25 bar and 80°C.

#### Hose

Chromium-plates brass

1/2" x 15 m

15 meters reinforced PVC with 3 couplings, article no. 0700,0701 and 0703. Can be cleaned at 60°C with a pressure of 8 bar.

#### **Automatic Watertight Coupling**

Chromiumplates brass

1/2" hose coupling with stop when disconnected from quick coupling. Max pressure 25 bar and 80°C.

#### **Trigger Operated Water Gun**

0.42

Polyoxy methylene

135×180×25

Fits hose, 0702, but can also be used with other hoses if you connect 0701 or 0716 on the hoses. Max pressure 4 bar and 60°C or max pressure 6 bar and 40°C.

#### Male / Female Coupling

Ø33 x 43

To be used for connecting 2 1/2" hoses. Max. pressure is 25 bar and 80°C.

#### **Automatic Watertight Coupling**

Chromiumplates brass

Protects the hose from being bent or twisted during use. With automatic water stop. Max. pressure is 25 bar and 80°C.

#### Hosenippel

Chromium-plates brass

1/2" hose union fits 1/2" and 3/4" hose.

**Dinga Water Gun** 

0711

60°C 140°F

Brass, STS, rubber

The water gun reduces water consumption. Squeezing the trigger determines the jet pattern, which makes the water gun suitable for many cleaning applications.

#### Quick Coupling 1/2"

80°C 176°F

Chromium-

plates brass

Ø24×32

½" quick coupling between 0711 water gun and hose. Max pressure 25 bar and 80°C.

#### Quick Coupling 3/4"

plates brass

3/4" Quick coupling between 0711 water gun and hose with hose coupling 0716. Max pressure 25 bar and 80°C.

#### Hose Coupling 3/4"

Chromium-plates brass

Ø34 x 43

3/4" hose coupling fits on 3/4" hose. Max pressure 25 bar and 80°C.

#### **Adapter fitting**

Chromium-

Ø30x22

Fits between Dinga Water Gun or handle and 34" coupling (0715). Max pressure 25 bar and 80°C.

**Toilet Brush** 

PP, PBT

Strong and efficient toilet brush with extra bristles to clean the flushing rim and long, ergonomic handle. On the holder is a hanger for the toilet brush.

#### Nylon pad, hard

5523

Suitable for cleaning stubborn dirt on textured surfaces.

#### Nylon pad, medium

5524

Suitable for removing stubborn dirt on tiles and ceramics.

#### Nylon pad, soft

Nylon

Suitable for removing greasy dirt on smooth surfaces.

#### **Nail Brush**

0,08

發

38x45x118

PP, PBT

Very solid nail brush with a hole for hanging in Vikan's wall bracket system. The brush can be used for cleaning hands/arms as well as small tables/surfaces and containers.

#### Vikan's focus on quality

At Vikan we constantly focus on the quality of our products and how to continue to improve them. In 1992 we were certified according to ISO9001. Since then we have made ongoing quality improvements of not only products, but also workflow and documentation.

#### How we perceive quality

At Vikan quality is more than just product appearance and properties. Not only our customers should be able to make heavy demands us. We also make heavy demands on ourselves. We see this as a precondition for being perceived as a serious supplier. We should be the first with new products, and we endeavour to be at the cutting edge of developments to such an extent that we can launch products our customers do not even realise they need. However, such products should solve an actual cleaning problem experienced by them. At the same time we guarantee our products to have been thoroughly tested before launching.

In order to ensure that the products fulfil our own expectations, we have established an internal test laboratory in Skive. In the laboratory we can perform the following analyses:

- Autoclave test
- · Durability is tested
  - Strength of the base
  - Strength of the individual filaments
  - Strength of each bunch of filaments
- User application
- Chemical testing

#### What we do to maintain our good quality

In order to live up to our own quality requirements, we have introduced 3 specifications.

- 1. Access control to the raw materials stock
- 2. Operator instruction
- 3. Packing instruction

The access control is a visual control of the raw materials with focus on colour, structure and surface. In addition, bases are tested as to homogeneity and dimensional requirements.

Before and during production, we also test how well filaments are secured to the brush. We have established a standard specifying 60 newton/bundle. Products not meeting this standard are rejected.

The packing instruction comprises all details about prepacking so that customers always experience uniform and safe packaging.

#### Chemical resistance of the tools

The tools of the Vikan hygiene system® are made of materials which primarily meet the requirements of the FDA. In addition, the resistance to various cleaning chemicals is important when selecting materials. A complete overview of the chemical resistance of the plastic materials used can be downloaded from our website at www.vikan.com.

# Procedures for cleaning of hygienic tools

- 1. Removal of all visible dirt and any foreign objects. When cleaning floor squeegees, we recommend removal of the cassette to enable individual cleaning of the parts. We recommend use of a Vikan brush with stiff filaments.
- 2. Clean the tool in a cleaning solution with a pH of approximately 9 or above. Use a Vikan brush with stiff filaments for this purpose or clean in a dishwasher. This solution and mechanical treatment will remove any deposits, fat and protein residues. Vikan products tolerate all approved alkaline cleaning agents (pH above 7).
- 3. Rinse with clean water.
- 4. If lime residues are formed on the tool after washing and use, these can be removed by washing in a cleaning solution with a pH of approximately 5 or less. Use a Vikan brush with stiff filaments or clean in a dishwasher. Vikan products tolerate all approved acidic cleaning agents (pH below 7).
- 5. Rinse the tool with clean water.
- 6. If required, tools can be disinfected after washing with an approved disinfectant. Vikan products tolerate all approved disinfectants.
- 7. Rinse with clean water to ensure the removal of any disinfectant residues on the tool before using it again for cleaning.
- 8. Please note!

If required under special circumstances, Vikan tools can be sterilised by autoclaving (temp. exceeding 121°C). A few products do not tolerate autoclaving. Therefore check the temperature in the VHS catalogue.

9. Place the tool to dry on Vikan's wall bracket systems.

Products which are hung up are more hygienic and last longer.

The brush has been used in a place where the filaments became stuck and were pulled out – the product should be replaced.

The filaments are tangled together because of long-term use – the product should be replaced.

The sponge rubber is wearing, becoming softer and starting to become porous. The product must be replaced when this occurs.

#### Hygiene tools and their treatment

Hygiene tools can be used in all places where the production requires a very high level of hygiene in all phases. The tools used in such places must be of a very special quality. And with such tools, you can specify the following requirements:

- a. They must be able to tolerate autoclaving at 121°C.
- b. They must be able to tolerate all approved cleaning agents.
- c. They must be made of materials which reduce the quantity of bacteria moved with the product.
- d. They must be easy to clean.
- e. They must dry quickly.
- f. They must be durable.
- g. They must promote a sound ergonomic work flow.
- h. They must be replaceable without major costs.

#### The right choice of materials

Not all materials can be used in the food industry. Materials such as wood and animal hair cannot be used because they do not tolerate disinfecting. Micro-organisms can "hide" in these materials and be transported from one place to another, causing cross-contamination.

Even if the tools are made of synthetic material, you cannot be sure of the quality. By gauging the tools weight you can reveal whether plastic with air bubbles in the material was used. If this is the case, the tool can be practically impossible to clean after use. A single scratch in the surface opens up thousands of hiding places for micro-organisms.

The filaments must be securely fixed and be able to recover their shape. Polyester is a good choice. Tools are often exposed to high temperatures and caustic chemicals, and it is important that they tolerate these.

When you buy a Vikan hygiene system® product, you can be sure that all these factors have been taken into consideration.

#### When is it time to replace the tools?

- a. When the filaments are so entangled that particles can adhere to them.
- b. When the filaments are so discoloured that after cleaning, they do not regain their original colour and it is difficult to see what is dirt and what's not.
- c. When the base is so damaged that bacteria can more easily adhere to it.
- d. When the handle is broken or cracked.
- e. When the filaments are worn or have been caught in something, increasing the risk of loose filaments.
- f. When the law specifies that the tools must be replaced after a suitable interval or if there may be a risk to our food.
